This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this, industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act, reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains—

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913 showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index," the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Guy G. George and Charles F. Yauch, of the Commission's staff, and of others.

PIPES AND SMOKERS' ARTICLES.

SUMMARY.

The value of the products of the industry manufacturing pipes and smokers' articles, excluding cigarette paper, was $4,220,000 in 1914. There were 47 establishments reported in the industry with a capitalization of $3,232,000, which employed 2,354 wage earners. The manufactures of cigarette paper are included with the manufactures of paper and not with smokers' articles.

Of the 47 establishments reported in 1914, 20 were located in the State of New York, and the establishments in that State manufactured 63.7 per cent of the total value of products and employed 63.3 per cent of the total number of wage earners. Other States in the industry were Missouri, Illinois, Massachusetts, and New Jersey.

According to one of the large paper manufacturers, the present tariff rate on cigarette paper will make it possible to undertake the development of this branch of the industry, although scarcely none is made in the United States at the present time. On the other hand, the duty on clay pipes valued at 40 cents per gross or less is declared by manufacturers to be much too low, since labor costs have been much lower abroad than in this country.

Amber was first included in the dutiable list at the rate of $1 a pound by the act of 1913, and meerschaum was also placed on the dutiable list for the first time at the rate of 20 per cent ad valorem. Neither article is produced in the United States. Briar root was first placed on the dutiable list by the act of 1909 in the hope that a domestic substitute would be produced or used, but no such substitute has been found which is satisfactory.

The statistical tables indicate clearly that the competition furnished by imports has been quite keen. The ratio of imports to production in 1914 was 32.1 per cent. This figure, however, includes cigarette paper in imports, while in reality there was practically no domestic production of cigarette paper. The percentage of those imports which offered direct competition with domestic products would, therefore, be considerably lower, probably about 15 per cent for the year 1914.

Pipes and smokers' articles—Summary table.

[1] Including cigarette books, covers, and papers.
[2] Census of 1909. Not including cigarette books, covers, and papers.
[3] Calendar year.

GENERAL INFORMATION.

1913 TARIFF PARAGRAPH.

381. Pipes and smokers' articles: Common tobacco pipes and pipe bowls made wholly of clay, 25 per cent ad valorem; other pipes and pipe bowls of whatever material composed, and all smokers' articles whatsoever, not specially provided for in this section, including cigarette books, cigarette-book covers, pouches for smoking or chewing tobacco, and cigarette paper in all forms, except cork paper, 50 per cent ad valorem; meerschaum, crude or unmanufactured, 20 per cent ad valorem.

DOMESTIC PRODUCTION.

The value of the products of the industry manufacturing "pipes and tobacco" (including cigarette and cigar holders) was $4,220,000 in 1914. The value in 1909 was $5,312,000. In 1914 there were 47 establishments reported, with a capitalization of $3,232,000 and employing 2,354 wage earners. The manufacture of cigarette paper is included with other manufactures of paper and not with this product.

Materials.—The chief material used in the construction of pipe bowls is briar wood or briar root, which is imported mainly from France and Italy. The supply of this material is decreasing and search is being made for a suitable substitute. Other woods are used extensively but are not considered a satisfactory substitute.

Clay and meerschaum are also used in the construction of pipes and pipe bowls. Meerschaum used in the manufacture of pipes, cigar and cigarette holders, and other smokers' articles comes principally from Asia Minor. It is a clayeylike mineral, white, soft, and light enough to float on water, known in mineralogy as sepiolite. It is a hydrous silicate of magnesium.

Pipestems are made of reeds, woods, hard rubber, or composition, as well as from many other materials. Mouthpieces for pipes and cigar and cigarette holders are also made from a variety of materials—reeds, woods, hard rubber, bakelite, celluloid, ivory, amber, and other materials.

Rice paper is used extensively for cigarettes.

A great variety of materials are used in the construction of pouches for tobacco, pipe cases, and other cases and accessories, chief among which are white pine, leather, rubber, plush or velvet for linings, metal fittings, and metal cases and holders.

Organization and methods of production.—This discussion does not include the manufacture of cigarette books, covers, and papers, which are included with the manufactures of paper. The figures given include pipe bowls and pipes of whatever material composed; also cigar and cigarette holders.

The number of establishments engaged in this industry has declined since 1899, when there were 98 reported. In other respects—capitalization, wage earners employed, and value of products—the industry increased from its beginning until 1909, but declined somewhat in 1914. In 1909 there were 62 establishments, capitalized at $3,528,000, employing 2,775 wage earners, and turning out products

valued at $5,312,000. In 1914 the number of establishments was 47, capitalized at $3,232,000, employing 2,354 wage earners, and turning out products valued at $4,220,000.

The industry is largely controlled by the corporate form of ownership with large capitalization, but the number of establishments owned by individuals is greater than the number under other forms of ownership, there being 25 owned by individuals, 16 by corporations, and 6 under some other form of ownership. One establishment employed 598, or 25.4 per cent of the total number of wage earners. Two other establishments employed 636, or 27.0 per cent of the total number, and 4 other establishments employed 563, or 23.9 per cent of the total number. From this it will be seen that in 1914, 7 establishments employed 1,797, or 76.3 per cent of the total number of wage earners.

The percentage of males over 16 years of age employed as wage earners in 1904 was 86.6 in 1909, 83.7 in 1914, 81.3. The percentage of females for the same census years was 11.6, 14.2, and 16.7. The number of wage earners under 16 for the same years was 1.8, 2.1, and 2. There has been an increase in the percentage of women employed, but female labor furnishes a comparatively small part of the total.

The value of products of corporations in 1914 amounted to $2,647,000, or considerably more than 50 per cent of the total for the entire industry. There were nine establishments with a capitalization between $100,000 and $1,000,000, and only one establishment with a capitalization over $1,000,000. These 10 establishments employed 1,997 of the 2,354 wage earners, and were credited with products valued at $3,632,000, or about six-sevenths of the total, in 1914.

The processes involved in the manufacture of pipe bowls of briar root, other woods, and meerschaum, are largely carried on with the aid of machinery, although less machine work is possible with meerschaum. A great deal of skill is required in certain of the final stages of manufacture, particularly in the case of meerschaum.

The manufacture of common clay pipes is a much simpler process, requiring less machine labor and less skilled hand labor. A complete enumeration of the processes, with costs of each, is found in a statement by the American Clay Pipe Works (Inc.), tariff hearings, Committee on Ways and Means, 1913, Volume V, pages 5731–5734. Fancy clay pipes require a number of hand processes, among which are molding, trimming, polishing, varnishing, and packing for shipment.

Geographical distribution.—New York is the leading State in the manufacture of pipes, 20 of the 47 establishments in 1914 being located in that State. New York employed 1,492, or 63.3 per cent of the total number of wage earners. The value of products of the industry in New York in 1914 was $2,689,000, or 63.7 of the total. Other States were Missouri, Illinois, Massachusetts, and New Jersey.

Domestic production, consumption, and exports.—There are no exports of the domestic products of this industry stated in the Statistics of Commerce and Navigation. This is no doubt due in part to the following reasons: (1) That the American manufacturer is practically entirely dependent upon imports of raw materials; (2) that there is no overproduction of pipes of desirable quality in this

country; and (3) that the cheaper pipes which are made from domestic woods or clay, as well as those made from the high-grade materials, can not be produced as cheaply in the United States as abroad.

The domestic industry grew gradually until 1909, when the value of the products of the industry reached a total of $5,312,000. The value in 1914 was $4,220,000 or considerably less than in 1909.

Imports amounted to 20.8 per cent of the value of domestic production in 1910 and 32.1 per cent of the value in 1914. However, imports for consumption in this case included cigarette books, covers, and papers, while the value of domestic products did not. In 1914 and later years the imports of cigarette books, covers, and papers grew out of all proportion to pipes and other smokers' articles but they did not exceed half of the total value of imports prior to 1914. Deducting the value of imports of cigarette books, covers, and papers would leave a figure more accurately comparable to domestic production, and the ratio would then be about 10 per cent and 15 per cent for the years 1910 and 1914, respectively.

It appears from these considerations that there is no overproduction of high-quality pipes. The decrease in the value of products from 1909 to 1914 may possibly be an indication that cigarettes are reducing the demand for pipes, but even with this consideration in mind, unless a satisfactory substitute for briar root is discovered, it is hardly probable that there will be an overproduction of high-grade pipes.

IMPORTS.

Prior to 1913 imports of pipes and smokers' articles were stated under one heading, and amounted to a little over $1,000,000 in value annually. The principal exporting countries were France, Austria-Hungary, United Kingdom, and Germany.

Since 1913 cigarette books, covers, and papers have been stated separately, and pipes and all other smokers' articles have been included in another class. The increase in imports of cigarette books, covers, and papers has been remarkable. In 1913 their value was $706,380, in 1916 their value was $1,247,799, in 1917, $3,893,653, and in 1920, $4,723,995. The highest was in 1918, $8,808,278. Practically all of this importation came from France.

The increased importation of cigarette paper was caused by the increased production of cigarettes, no doubt due to the demand caused by the war. The production of cigarettes in the United States has increased from about 17,000,000,000 in 1914 to 40,000,000,000 in 1919. The French have had a practical monopoly of the manufacture of cigarette paper. In the past there has not been sufficient incentive for American paper makers to enter the field. The paper is a difficult one to make; stock is expensive and not easily obtained; the volume of the business formerly was not large; foreign costs of manufacture were low; and the American manufacturer was not encouraged to undertake the development work required to carry on the manufacture of cigarette paper.

TARIFF HISTORY.

Pipes, pipe bowls, and all smokers' articles not specially provided for, including cigarette books, covers, and papers, were assessed at 50 per cent ad valorem by the act of 1894; pipes of clay valued

at not more than 50 cents per gross, at 10 per cent ad valorem; meerschaum crude or unmanufactured, free.

The act of 1897 raised the duty on pipes and pipe bowls not of clay, and other smokers' articles, including cigarette books, covers, and papers, to 60 per cent ad valorem. Clay pipes were divided by this act into common pipes valued at not more than 40 cents per gross, which were assessed at 15 cents per gross, while other clay pipes and bowls were assessed at 50 cents per gross and 25 per cent ad valorem. Meerschaum unmanufactured remained on the free list.

The act of 1909 made no change whatever with respect to pipes and smokers' articles. The act of 1913 eliminated all specific duties and made clay pipes dutiable at 25 per cent ad valorem; other pipes and smokers' articles of whatever material composed, including cigarette books, covers, and papers, were reduced from 60 per cent ad valorem to 50 per cent ad valorem; and meerschaum was made dutiable for the first time at 20 per cent ad valorem.

COMPETITIVE CONDITIONS AND TARIFF CONSIDERATIONS.

Correspondence with manufacturers of pipes and smokers' articles has not yielded much information with reference to foreign competition under the present rates, on account of the war. Post-war conditions can not be predicted at this time. Under the present rate it is stated by a large paper manufacturer that it will be possible to undertake the manufacture of cigarette paper.

In the Tariff Hearings of 1908–9 before the Committee on Ways and Means, pp. 7305–7311, it was said that the existing duties at that time were fair, except on clay pipes costing 40 cents or less per gross, on which it was claimed the duty should not be below 25 cents per gross. Again in 1913, Tariff Hearings, Committee on Ways and Means, 1913, pp. 5731–5734, an argument was presented along this same line, supported by a detailed comparison of the costs of production in New York and Scotland.

The paragraph can be reworded so as to include all pipes and smokers' articles or parts of pipes and smokers' articles of whatever material composed, in finished or partly finished condition. Such a revision would prevent the evasion of the duty which is now possible.

The act of 1913 lowered the duty on pipes and smokers' articles, excepting clay pipes, from 60 per cent ad valorem to 50 per cent ad valorem. At the same time this act assessed a duty on two raw materials on which a duty had not been assessed, amber and meerschaum.

All of the amber used in the United States comes from the Baltic. It is obtained from mines in Samland, East Prussia. Imports of amber were first assessed by the act of 1913 at the rate of $1 a pound.

Meerschaum is mined in Asia Minor, and does not compete directly with any domestic product. It was first placed on the dutiable list by the act of 1913 at the rate of 20 per cent ad valorem.

An American manufacturer writes concerning parts of pipes:

> The present phraseology has made it possible for importers in our line to bring into this country completed pipe bowls, with the exception of the draft hole, and classified them as "manufactures of wood," under paragraph No. 176. The argument of the importer is to the effect that the article only becomes a pipe bowl when entirely completed. In other words, the absence of the draft hole reduces

the classification of duty from 50 to 15 per cent. The boring of the draft hole is the most trivial of all the operations, and therefore the least costly. * * * Let us explain that the importation of these bowls at 15 per cent has only been the practice within the last couple of years, and only in minor quantities on account of the war. The point we make to-day is to avoid the seriousness of this condition affecting us when times are again normal.

		Meerschaum, crude or unmanufactured	20 per cent ad valorem.

Court and Treasury Decisions.

"All smokers' articles whatsoever" is a comprehensive term, the use of the words "all" and "whatsoever" leaving little doubt as to the intention of Congress, and the intensified form of the phrase as a whole manifests a purpose to reach out into all branches of trade and commerce and to gather within the provision everything used chiefly by smokers in that pursuit and for that purpose, irrespective of other provisions within which they may be included. (Knauth *v.* United States, 1 Ct. Cust. Appls., 334, of 1911; Bush *v.* United States, 10 Ct. Cust. Appls., T. D. 38402, of 1920.) Unfinished parts, however, are not within the paragraph. In a case under the act of 1894 unfinished meerschaum pipe bowls were held dutiable as articles composed of earthy or mineral substance (G. A. 3405, T. D. 16977, of 1896). In a case under the act of 1897 lengths of polished hard rubber intended to be divided and made into two mouthpieces for pipes were held dutiable as manufacture of rubber. (G. A. 4590, T. D. 21719, of

1899.) And in a case under the act of 1913 wood roughly carved into the shape or form of a pipe bowl, but not sufficiently advanced in manufacture to answer the purpose of a pipe bowl, was held dutiable as a manufacture of wood. (G. A. 7771, T. D. 35697, of 1915.) On the other hand, mouthpieces for pipes finished but not designed to be used in any particular pipe or pipestem being made for insertion in any pipe or stem so constructed as to receive them were held to come within the provision of "all smokers' articles whatsoever" in act of 1909. (United States *v.* Hanover Vulcanite Co., 4 Ct. Cust. Appls., 503, of 1913.) The doctrine of ejusdem generis has no application in construing this provision. (Steinhardt *v.* United States, 126 Fed. 443, of 1903.)

Paragraph 381 of the act of 1913 has been held to include the following articles:

A smoker's table with 12 ash trays for same (Abstract 37609, of 1915);

Decorated earthenware in the shape of humidors, cigar trays, ash receivers, etc. (Abstract 37798, of 1915).

Cigarette machines consisting of a tubular piece of brass about one-fourth inch in diameter, split in half and hinged and capable of being used to assist the smoker in rolling a cigarette (Abstract 40097, of 1916).

Lithographed tin boxes about 6 inches square and 1 inch deep, hinged tops, used as containers for cigarettes, imported empty (Abstract 39627, of 1916)

Amber cigar and cigarette holders complete and capable of being used as a cigar or cigarette holder, but having a slight depression evidently made for a gold band not necessary to its use and apparently serving no other purpose than ornamentation (Abstract 40001, of 1916).

So-called cigarette holders made of glass having a metal reed were held dutiable according to the component material of chief value, and not as smokers' articles nor as toys. (T. D. 34050, of 1914.)

Glazed clay pipes (T. D. 35963, of 1915) and clay pipe bowls (Abstract 36337, T. D. 34742, of 1914).

Bamboo pipestems 5 inches in length, one end cut off square just back of a joint, thus forming a mouthpiece, and the other end tapered to fit into the pipe. (Bush *v.* United States, 10 Ct. Cust. Appls., T. D. 38402, of 1920.)

Pipe bowls of the commonest variety were held properly dutiable at 25 per cent under the first clause of paragraph 381 and not at 50 per cent under the second clause. (Abstract 44013.)

Cigar lighters were held classible as smokers' articles under the act of 1909 (Bernhardt *v.* United States, 4 Ct. Cust. Appls., 36, of 1913), but pocket cigar lighters were held to be dutiable under paragraph 356 of the act of 1913 as articles designed to be carried on the person, by virtue of the provision in paragraph 386 imposing the higher of two rates applicable to unenumerated articles. (Bischoff *v.* United States, 7 Ct. Cust. Appls., 138, of 1916.)

turers as agents of American and English houses have secured control of the output. An American consul in a report on the supply of meerschaum in Austria stated that up to the present time (1907) there had been no serious complaint regarding the lack of crude meerschaum, though the effect of such a scarcity may be seriously felt later. In 1911 the American consul at Prague stated "the valuable material from which meerschaum pipes are made is continually getting scarcer, and the large industry which has flourished in Vienna, Budapest, Nuremberg, Paris, and in the Thuringian town of Ruhla seems endangered."

IMITATIONS.

A cheap artificial imitation of meerschaum is made from gypsum, hardened, treated with stearic acid or paraffin, polished and colored by a solution of gamboge and dragon's blood. Imitation meerschaum is said to be manufactured in France from potatoes.

IMPORTS.

Almost the entire output of meerschaum of Asia Minor is sent to Vienna and thence distributed to various European countries and to the United States. Very little, if any, is imported directly into the United States from Asia Minor. Practically all of the meerschaum imported into the United States comes from Austria-Hungary. Some comes from Germany and some from Turkey in Europe. In view of the fact that the United States is considered the best purchaser of the Asia Minor product, it seems rather surprising that purchases should not be made directly on the spot or through Constantinople instead of through Vienna. From 1910 to 1915, inclusive, the value of imports from Austria-Hungary was in no year less than 85 per cent of the total value imported. In 1910 all of the meerschaum imported into the United States came entirely from Austria-Hungary; imports for this year were valued at $227,314. No general imports are shown for the years 1916, 1917, and 1919. In 1918 imports amounted to only $4 and in 1920 to $52,274.

TARIFF HISTORY.

Before the act of 1913 meerschaum in its crude or unmanufactured state was admitted into the United States free of duty. The act of 1913 imposes a duty of 20 per cent ad valorem.

TARIFF CONSIDERATIONS.

Manufactures of meerschaum, when not properly classifiable under paragraph 381 relating to pipes and smokers' articles, are dutiable under paragraph 81 as articles composed of earthy or mineral substances. Such articles bear the same rate of duty as crude meerschaum.

HATTERS' PLUSH.

(Par. 382. For treatment see par. 314.)

BRIAR ROOT OR BRIAR WOOD.

General Information.

TARIFF ACT OF 1913.

Paragraph 168 of the tariff act of 1913 reads: "Briar root or briar wood, ivy or laurel root, and similar woods, unmanufactured, or not further advanced than cut into blocks, suitable for the articles into which they are intended to be converted, 10 per cent ad valorem."

DESCRIPTION.

Briar root or briar wood is an imported wood derived from the white or tree heath (Erica Arborea) which flourishes in Italy and Algeria, and grows in small quantities also in Spain, France and Greece. The wood is obtained from the burl where the trunk expands, at the base and is the only part of the tree used. The ivy and laurel woods are of domestic growth, found chiefly in North Carolina. They are somewhat similar in appearance and quality to the briar root, but are much softer and impractical for the manufacture of pipes.

USES.

The only use or at least the only important use of briar wood is in the manufacture of tobacco pipes.

SUBSTITUTES.

Any substance used in making pipes, such as clay or meerschaum, may be regarded as a substitute. Attempts have been made to use the domestic ivy and laurel woods in place of the imported briar wood but these substitutes have not been found satisfactory by manufacturers. Other domestic woods, which are used as substitutes, are apple (for cheaper grades), manzanita, wild lilac, red gum, and birch. Ebony, an imported wood, is also used.

IMPORTS.

Importations since 1910 range between two and five hundred thousand dollars in value. The chief sources of supply are France, Italy, and French Africa. Imports are shown in more detail by the following table.

PRICES.

Prices since 1910 for blocks of the principal size are quoted by a leading manufacturer as follows: 1910, $4; 1912, $4; 1914, $6; 1916, $7 to $12; 1918, $16; 1919, $16; 1920, $16 for the first six months, later 10 per cent reduction. Quotations are per gross.

TARIFF HISTORY.

Briar wood was admitted free of duty before the act of 1909. In that year it was subjected to a 15 per cent ad valorem duty, which was reduced to 10 per cent in 1913. In the hearings preceding the act of 1909 petitions were made for a duty for the purpose of developing the laurel and ivy root industry in North Carolina, Tennessee, and Virginia.

COMPETITIVE CONDITIONS.

Although briar wood has been on the dutiable list since 1909, the domestic industry has not been developed. The difficulty is not one of comparative costs of production but of quality. Pipe manufacturers claim that the domestic woods are not suitable for the manufacture of smoking pipes. The wood is too soft and will not stand the heat of the burning tobacco.

Briar root or briar wood and ivy or laurel root—Imports by countries.

COURT AND TREASURY DECISIONS.

Briar root or briar wood has been provided for by name in the last five tariff acts.

In a decision of 1877 under the Revised Statutes blocks of briar wood roughly sawed into a form from which smokers' pipes are manufactured were held to be dutiable as wood unmanufactured and not as wood manufactured.—Dept. Order, T. D. 3411. The question whether these blocks were of cabinet wood was not raised.

The matter came up again under the act of 1883. The evidence showed that the importation consisted of briar-wood blocks of various sizes and forms such as were used by manufacturers of pipes, pipe bowls, and cigar holders. The evidence also showed that briar wood was extensively used in the arts and in the construction of the finest cabinet work because of its variegated appearance and its hardness and capacity for being carved and highly polished.

The department held the blocks exempt from duty as cabinet wood unmanufactured, notwithstanding almost exclusive use in the manufacture of smokers' articles.—Dept. Order, T. D. 7366. This is the case referred to in the tariff hearings of 1890 at page 1019.

Blocks of wood cut to size and prepared for engravers' use for making wood type, classified under paragraph 215 of the act of 1909, were held dutiable under paragraph 202. (Abstract 32937, T. D. 33594, of 1913.)

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this, industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act, reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Guy G. George, of the Commission's staff, and of others.

PHOTOGRAPHIC GOODS.

SUMMARY.

The photographic goods industry was credited with 146 establishments in 1914, capitalized at $36,388,000, employing 8,674 wage earners, and turning out products valued at a total of $39,041,000. These figures include articles not mentioned in tariff paragraphs 380 and 576, but which properly belong in any discussion dealing with the items enumerated in those paragraphs; in fact, they can not be separated from the available data.

New York is the leading State in the production of photographic goods, 59 of the 146 establishments reported in 1914 being located in that State. The establishments in New York employed 4,762 of the wage earners and turned out products valued at $35,175,000, which was nearly seven-eighths of the total. Other States in the industry were Illinois, Missouri, Massachusetts, Ohio, Pennsylvania, New Jersey, and California.

There seems to be little or no serious foreign competition, which may be largely due to the fact that one large American firm not only completely dominates the situation in the United States but practically dominates the business in the whole world. The quality of the American product is generally admitted to be the equal if not the superior of all others. The American producer has been the pioneer and the leader in the production of kodaks, films, and motion-picture films and apparatus.

Exports of photographic goods reached their highest point with a total of more than $25,000,000 in 1920 calendar year. Imports for consumption reached their height in the same year, with a total of $5,289,612.

The effect of the lower rates of the act of 1913 had the war not occurred can not be accurately predicted, but taking the situation as it exists to-day foreign competition is not serious and does not threaten to be so in the immediate future.

Film scrap, made from film of American manufacture, is now imported for the purpose of recovering the constituent elements, and is assessed at 10 per cent ad valorem under paragraph 384, as waste not specifically provided for. However, foreign-made film, sensitized but not exposed or developed, is free of duty, paragraph 576. It should also be noted that paragraph 404 contains a provision relating to the return of plates or films of American manufacture, damaged or worn out, and fit only for the recovery of the constituent materials.

General Information.

1913 TARIFF PARAGRAPHS.

PAR. 380. Photographic cameras, and parts thereof, not specially provided for in this section, photographic dry plates, not specially provided for in this section, 15 per centum ad valorem; photographic-film negatives, imported in any form, for use in any way in connection with moving-picture exhibits, or for making or reproducing pictures for such exhibits, exposed but not developed, 2 cents per linear or running foot; * * * photographic-film positives, imported in any form, for use in any way in connection with moving-picture exhibits, * * * including herein all moving, motion, motophotography or cinematography film pictures, prints, positives or duplicates of every kind and nature, and of whatever substance made, 1 cent per linear or running foot: *Provided, however,* That all photographic films imported under this section shall be subject to such censorship as may be imposed by the Secretary of the Treasury.

576. Photographic and moving-picture films, sensitized but not exposed or developed. Free.

DESCRIPTION.

There are other articles which should be included in a full discussion of photographic goods, such as sensitized paper, moving-picture machines, and many other materials and apparatus. This survey aims to deal mainly with photographic cameras and films, but the statistical data in general deals with all photographic goods.

Imports have consisted principally of motion-picture films. Before the act of 1913 they were classed principally under "Motion-picture films, positives," but since the act of 1913 imports have been greater under the free list, "Motion-picture films, sensitized, but not exposed." Films entering as motion-picture positives or negatives are, in many cases, films which were no doubt manufactured in the United States but exposed abroad.

With reference to a reclassification of film scrap, see Summary, page 8.

64912—21—N-25——2

DOMESTIC PRODUCTION.

The value of the products of the photographic goods industry in the United States in 1914 was reported to be $39,041,000. This total includes articles not covered in paragraphs 380 and 576. There were 146 establishments reported, with a total capital of $36,388,000, employing 8,674 wage earners.

Materials and methods of production.—The greatest portion of the value of the products of the industry is turned out by the film branch. Celluloid forms the base of all photographic films and is manufactured extensively in the United States. According to the testimony presented before the Committee on Finance, 1913, celluloid is manufactured more cheaply in the United States than abroad:

> The pyroxyline support (cellulose) is made from a solution of pyroxyline (cellulose treated with nitric and sulphuric acids) in solvent menstrua, which solution is spread upon a suitable surface and dried (by evaporation of the solvent menstrua).
>
> The menstruum used by the Eastman Co. in the manufacture of its film support is wood alcohol, acetone, and fusel oil, camphor being added to the solution. That used by the Goodwin Film and Camera Co. in the manufacture of the Ansco film support is wood alcohol, fusel oil, and amyl acetate, a secret ingredient being added to the solution.
>
> In each case the quantity of menstruum is about five times, by weight, the quantity of pyroxyline.
>
> This pyroxyline film, when dried, is coated with the sensitized gelatin emulsion * * *. This consists of an aqueous solution of gelatin containing nitrate of silver, there being approximately equal parts of the two.[1]

The industry has been entirely dependent upon imported camphor, but the recent developments in the manufacture of synthetic camphor promise to free the industry from this position.

Glass and gelatin used in the manufacture of dry plates were imported prior to the war, but the domestic manufacturer has not been dependent upon imports of these materials since the war. However, there is only one manufacturer of photo glass in the United States, and it is reported that they now threaten (Apr. 23, 1920) to shut down their photo-glass department. Previous to the war one dry-plate company imported 90 per cent of their glass and gelatin.

Formerly all of the paper stock used for photographic paper was manufactured abroad, but owing to an improvement in the sensitizing solution now used American paper can be and is used.

Organization.—The corporate form of ownership predominates in the photographic goods industry, 85 of the 146 establishments reported in 1914 being owned by corporations, 44 by individuals, and 17 by some other form. The total average number of wage earners in the industry in 1914 was 8,674, of whom 8,429 were employed by corporations. The total value of products in 1914 was $39,041,000, of which $38,259,000 was credited to corporations.

There are a great number of small establishments engaged in the industry, but the number of establishments turning out a product of $100,000 or more in value was only 21 in 1914. These 21 establishments employed 7,693 of the wage earners. Only one establishment was reported with a product of over $1,000,000 and employing over 1,000 wage earners. This establishment was credited with a product of $33,489,000, and with 5,370 of the wage earners in 1914.

---

[1] Tariff Hearings, Committee on Finance, 1913, pp. 1711, 1712.

It is quite evident that one establishment alone has a very large share of the entire industry. The capital of all establishments in 1914 was $36,388,000. The capital stock of the Eastman Kodak Co. was given as $25,698,500 in 1914, by Poor's Manual of Industrials. As reported by the Standard Statistics Co., the capital stock of the Eastman Kodak Co. in 1918 was $25,704,100.

While it is true that the industry is dominated by the corporate form of ownership, in fact by one large corporation with a large capitalization, it does not follow that the manufacture of photographic goods necessarily requires a large establishment. The fact that there are 146 establishments reported leads to the conclusion that the industry may be carried on by small manufacturers, at least certain branches of the industry.

Geographical distribution.—New York is the leading State in the production of photographic goods, with 59 of the 146 establishments reported in 1914. The establishments in New York employed 4,762 of the wage earners, or more than 50 per cent of the total, and turned out products valued at $35,175,000, which was approximately seven-eighths of the total.

Illinois had 18 establishments, with a product valued at $1,315,000. Missouri had 9 establishments, with products of photographic materials alone valued at $1,007,000 (photographic apparatus not stated). Some of the other States were Massachusetts, Ohio, Pennsylvania, New Jersey, and California.

History of the industry.—The development of the industry has taken place mainly since the census of 1889, when the value of products was $2,745,000. In round numbers the increase for the subsequent census years has been as follows: 1899, $8,000,000; 1904, $13,000,000; 1909, $22,000,000; 1914, $39,000,000. Generally speaking, the tariff rate was 25 per cent ad valorem from 1894 until 1913.

The growth of the industry does not appear to be closely connected with the tariff. In support of this view the following extract is quoted from the statement of the Eastman Kodak Co. before the Committee on Finance, tariff hearings, 1913, pages 1708, 1709:

> In fact, it may be stated that the Eastman Co. has been viewed for years, both here and abroad, not only as the originator and developer of amateur photography, but as the leading manufacturer of photographic apparatus and supplies generally in the world, and it attained this leading position and has maintained it during all these years, not because of its wealth, but simply and solely because of the quality of its products and its fair treatment of the public in the matter of the price thereof.

Domestic production and consumption.—The total value of products of the photographic goods industry (including both photographic apparatus, such as cameras, motion-picture machines, and other apparatus, and photographic materials, such as films, sensitized paper, and other materials), was $39,041,000 in 1914. Photographic apparatus was valued at only $4,273,000, while photographic materials reached a total of $34,768,000.

Imports have been small, amounting to less than $3,000,000 in 1914, the greater portion of which probably consisted of imports of films manufactured in the United States but exposed abroad, while exports amounted to $9,431,800 in 1914 and more than $25,000,000 in 1920 (calendar year).

It appears from these facts, and also from the foregoing statement with reference to the leading position of the United States in the photographic goods industry, that domestic consumption is almost entirely supplied by domestic production, and that exports now account for a considerable portion of the total sales.

Domestic exports.—The value of exports has been increasing rapidly in recent years, the total in 1910 being $4,765,155, while the total in 1920 was $25,431,652.

Exports of photographic goods were not separately stated prior to 1912. In 1912 the value of exports of cameras was $563,151, while the exports of motion-picture films reached a total of 80,000,000 linear feet, valued at $6,815,060.

The exports of cameras have increased considerably, reaching their highest total in the year 1920, with a value of $3,548,433. Films have been divided since 1912 into motion-picture films not exposed, exposed, and other sensitized goods (including other films). Motion-picture films, not exposed, reached their highest exportation since the year 1910 in the year 1914, with a total of 153,359,550 linear feet, valued at $4,264,722. Motion-picture films, exposed, reached their highest footage total since 1910 in the year 1916, although the value of exports was greater in 1919 with a decreased footage. The figures are 158,751,786 linear feet in 1916, with a value of $6,757,658, and 153,237,260 linear feet, valued at $8,066,723, in 1919. Other sensitized goods exported in 1916 were valued at $3,596,597, but it is not known what part of this total consisted of films. The exports of all other photographic apparatus and goods reached their height in 1920, with a total value of $6,303,433.

It is evident that motion-picture films are by far the most important item of export in this industry, furnishing $10,746,986 in 1919 of the total export of photographic goods, or approximately one-half of the total exportation.

The destination of American exports is given in detail in the statistical tables. England, Canada, France, Australia, and Italy have been the principal purchasers of American exports, but they have also been pretty thoroughly scattered all over the world.

IMPORTS.

Imports for consumption have remained quite constant since 1910, at a value somewhat in excess of $1,000,000 and averaging about $1,500,000. In 1914 and 1920 the totals were considerably above the average, reaching the total of $2,913,293 in 1914 and $5,289,612 in 1920 (calendar year).

The import figures in this case are not of much value with reference to the question of foreign competition, since it is not known what portion of the imports are distinctly of foreign origin. Prior to the act of 1913 imports were stated only for motion-picture positives; motion-picture films, all other; and all other films and plates. Since 1913 several additional classes have been added, as will be seen from the following statement of the trend of imports:

Cameras and parts of, amounting to a value of $247,290 in 1914, declined to the sum of $2,152 in 1918, but reached their highest value, $355,660, in 1920 (calendar year).

Dry plates were not separately stated until 1916, when imports were valued at $74,183, declining to $58,669 in 1920.

Motion-picture films, sensitized but not exposed, free, were first stated in 1914, and imports were valued at $889,560. They did not fluctuate materially between that time and 1918, but in 1919 declined to $283,271, and in 1920 reached their highest, $1,697,976.

Motion-picture films, negatives, dutiable, were valued at $402,704 in 1914 and at $728,899 in 1920.

Motion-picture films, positives, dutiable, reached their height in 1914, with imports valued at $1,009,469, but declined to a value of $204,217 in 1920.

Imports of other films, sensitized but not exposed, free, have increased in value from $59,880 in 1914 to $2,248,666 in 1920, this latter, with the exception of $5,943, being the value of importations from Canada.

All other films and plates, dutiable, have been pretty well distributed among the other classes since 1914, and have been credited with no imports since 1915, when their value was only $91,294.

Summarizing the above classes of imports for 1920 discloses the fact that about three-fourths of the total value was imported under the free list, which consisted principally of motion-picture films, sensitized but not exposed. The comparative totals were: Free list, $3,949,867; dutiable, $1,339,745. Probably a large part of the celluloid base of the imported sensitized motion-picture film was manufactured in this country, but sent abroad to be sensitized.

Imports have come principally from France, Germany, Italy, and England.

PRICES.

During the war the prices of spool films were higher in England than in the United States. For the purposes of comparison the post-card size 6-exposure roll film is taken. The net wholesale price of this film in the United States is now (June, 1920) $35.91 per 100 rolls, the retail price, including the war tax, being 55 cents each. Before March 15, 1920, the retail price, not including the war tax, of this film was 40 cents. The 1919 catalogue price of English roll films, the same size, at normal exchange, was 56 cents. The present price, if any change has been made, is not known.

The price of English plates, 6½ by 8½, at normal exchange, is $3.36 a dozen, while the American list is $1.90 a dozen. Duty is paid on English film at the above price, that being the market value in England.

TARIFF HISTORY.

Photographic films and photographic dry plates were assessed for duty in the act of 1894 at 25 per cent ad valorem. No change was made in the act of 1897. The act of 1909 provided a specific duty of 1½ cents per linear foot for motion-picture positives, but otherwise the duties on films and plates of all kinds remained at the same rate.

The act of 1913 placed photographic and moving-picture films, sensitized but not exposed or developed, on the free list. A duty of 15 per cent ad valorem was assessed on cameras and parts thereof, and the duty on dry plates was reduced to 15 per cent ad valorem.

64912—21—N-25——3

Motion-picture negatives, exposed but not developed, were assessed at 2 cents per linear foot; if developed also, 3 cents per linear foot; while motion-picture positives were reduced from 1½ cents to 1 cent per linear foot.

The effects of the changes made by the act of 1913 are not entirely obvious. The total value of imports in 1914 was considerably greater than in former years. There was an increase in the value of imports subject to duty, and in addition, imports valued at nearly $1,000,000 were entered free of duty. It would appear that the changes in the act of 1913 stimulated imports. Since 1914 there has been a decrease in total imports, no doubt due to the war.

The effect of placing films not exposed or developed on the free list is quite evident, as imports under the free list have increased over 1913, while imports under the dutiable list have decreased since 1913. The extent to which this tendency might have affected American manufacturers had the war not intervened can not be accurately estimated.

At the same time that imports of films, sensitized but not exposed, have increased in value under the free list, exports of this class of films have decreased. It would appear that there was less demand for such film abroad; a greater demand for it in the United States; that the manufacture of motion-picture film, or its sensitizing at least, had been developed abroad; or possibly that a combination of these factors may have existed.

COMPETITIVE CONDITIONS AND TARIFF CONSIDERATIONS.

It will be seen by reference to the summary tables, page 9, that the ratio of exports to domestic production exceeded the ratio of imports to domestic production nearly three times in 1914. This appears to be conclusive evidence that foreign competition was not serious before the war, at least when total values are considered. During the war importation decreased, and exports from the United States increased greatly, reaching a total of nearly $16,000,000 in 1915, as compared with imports valued at less than $1,500,000.

The Eastman Kodak Co. has been held to be an illegal monopoly by decree of the District Court of the United States, Western District of New York, January 20, 1916.[1] The Eastman Kodak Co., according to its own statement, "has been viewed for years, * * * as the leading manufacturer of photographic apparatus and supplies generally in the world, * * *."[2] The case against the Eastman Kodak Co. is pending on appeal in the United States Supreme Court.

The present market price of dry plates is higher abroad than in the United States. Glass and gelatin, used in the manufacture of dry plates, were imported almost wholly before the war, and there is an indication that the American makers will be dependent upon imports for glass again in the near future. Camphor is another essential material in the manufacture of films.

The importation of motion-picture films under the free list increased under the act of 1913. The value of exports of motion-picture films, not exposed, in the fiscal year 1918 was $1,385,291, com-

[1] See Fed. Rep., vol. 226, pp. 62–81.
[2] See Tariff Hearings, Committee on Finance, 1913, pp. 1708, 1709

pared with an import value of $739,135. Since the Eastman Co. has extensive manufacturing interests in European countries, it is possible that some of this film might have been manufactured by them abroad.

The imports of cameras, dry plates, and other films and plates have been relatively small, while the exports of these classes have been quite large in comparison.

From the foregoing, excepting possibly in the case of certain materials, there does not appear to be any particular tariff problem involved in a consideration of the photographic goods industry.

Photograph goods—Production in United States by States.

Court and Treasury Decisions.

Cinematograph or moving-picture films were held to be photographs dutiable under paragraph 403 of the act of 1897. (United States *v.* Sussfeld, 1 Ct. Cust. Appls. 51, of 1910.) A camera without lens was held dutiable under paragraph 111 of that act relating to optical instruments, or frames, or mountings for the same (Abstract 18446, T. D. 28850, of 1908), and enlargers, plate holders and slides for cameras were held dutiable under paragraph 108, a similar provision in the act of 1909. (Abstract 32370, T. D. 33433, of

1913.) Camera tripods were declared not to be parts of cameras within paragraph 380 of the act of 1913, but dutiable as manufactures of metal under paragraph 167. (G. A. 7650, T. D. 34998, of 1914.)

The following articles were held dutiable as cameras or parts thereof under paragraph 380:

Enlarging cameras. (G. A. 7915, T. D. 36451, of 1916; Abstracts 40930 and 41125, of 1917.)

Photographic screens, invoiced as "ecrans" to be attached to a square frame on the lens of the camera, used in taking pictures in colors. (Abstract 40173, of 1916; Abstract 41167, of 1917.)

Photographic screens composed of two sheets of plain glass having a coat of geletin and balsam between them. (Abstract 40486, of 1916.)

Cooke's process prisms in the shape of a triangular prism, the back and two sides entirely of metal, a lens in each of two faces, etc. (Abstract 39352, of 1916; Abstract 41177, of 1917.)

Cameras with microscopes and other parts imported together, but each having a separate invoiced price, were classified by the collector as entireties with the microscope under paragraph 94, but the cameras were held separately dutiable. It was shown that the camera is sometimes used with the microscope and at other times separately and independently. (Abstract 40680, of 1917.) An exposed and developed photograph-film negative printed from a positive taken from the original negative is not dutiable as "photographic-film negatives" at 3 cents, but at 1 cent per linear or running foot under this paragraph as "moving, motion, motophotography or cinematography film pictures * * * of duplicates of every kind and nature." (G. A. 8039, T. D. 37073, of 1917, following Abstract 39882, of 1916.)

Scraps of sensitized film produced in cutting to small sizes large rolls of photographic film, suitable for no other commercial purpose than the recovery of the silver salts and the pyroxylin were classified as waste under the act of 1909. (G. A. 7133, T. D. 31130, of 1910.)

Evidence in accordance with the regulations of the Treasury Department must be produced for the free entry of moving-picture films as American goods exported and returned. (T. D. 34892, of 1914, and Stone *v.* United States, 7 Ct. Cust. Appls. 439, of 1917.)

Under the act of July 31, 1912, any film or other pictorial representation of a prize fight, under whatever name, which is designed to be used or made to be used for public exhibition, is forbidden importation under penalty of fine or imprisonment, or both. (Weber *v.* Freed, 239 U. S. 325, and Kalisthenic Exhibitor Co. (Inc.) *v.* Emmons, 225 Fed. 902, of 1915.) An encounter conducted between two pugilists or boxers under the Marquis of Queensbury rules in a 24-foot ring, the contestants wearing regular boxing gloves, 5 ounces in weight, and the contest being limited to 20 rounds, is a prize fight within the meaning of the statute. A picture film representing such a contest is prohibited importation and subject to libel and condemnation. (T. D. 35531, of 1915.) A negative film made on the American side of the Canadian border from a positive film exposed on the Canadian side is also within the prohibition. (Pantomimic Corp. *v.* Malone, 238 Fed. 135, of 1916.)

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for, and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report, the Tariff Commission had the services of Guy G. George, of the Commission's staff, and of others.

WORKS OF ART.

SUMMARY.

The United States is the only great Nation which places an import duty on works of art. However, the act of October 3, 1913, has practically placed art on the free list, as is indicated by the value of imports entered for consumption during recent years. For example, in 1914 works of art to the value of $36,000,000 were entered free of duty and only $700,000 were entered as dutiable. In 1920 works of art valued at $28,000,000 were entered free of duty, while only $525,000 were entered as dutiable.

Paragraph 376 imposes a duty of 15 per cent ad valorem on works of art not specially provided for. This applies in a general way only to those works which are not original works of an artist, ancient art, the production of American artists abroad for use in exhibitions, for religious or educational purposes, and which are not for presentation to public institutions. It will be seen that nearly all art can now be imported under the free list.

Paragraph 376 affords little revenue, which was $78,889 in 1920, and only a little over $100,000 in any year since 1913. Works of art can not be discussed from a tariff viewpoint in the same way that other articles of commerce can. Art seems to be one field in which foreign competition of neither the poor nor the good product is feared, but rather the American artist feels that his own livelihood depends to a great extent upon the free importation and exhibition of works of art, both ancient and contemporary.

The arguments and facts presented in the tariff hearings (1908–1909, pp. 7205 to 7277, and in 1913, pp. 5692 to 5708), together with opinions of artists and directors of galleries recently obtained, lead to the conclusion that no import duty is desired on works of art. The act as it exists at present has not, however, aroused any particular criticism.

Summary table.

FREE.

General Information.

1913 TARIFF PARAGRAPHS.

376. Works of art, including paintings in oil or water colors, pastels, pen and ink drawings, or copies, replicas or reproductions of any of the same, statuary, sculptures, or copies, replicas or reproductions thereof, and etchings and engravings, not specially provided for in this section, 15 per cent ad valorem.

611. Statuary and casts of sculpture for use as models or for art educational purposes only; regalia and gems, * * * for the use and by order of any society * * * for religious, philosophical, educational, scientific, or literary purposes, * * * free of duty.

652. Original paintings in oil, mineral, water, or other colors, pastels, original drawings and sketches in pen and ink or pencil and water colors, artists' proof etchings unbound, and engravings and woodcuts unbound, original sculptures or statuary, including not more than two replicas or reproductions of the same; * * * free of duty.

653. Works of art, drawings, engravings, photographic pictures, and philosophical and scientific apparatus brought by professional artists, lecturers, or scientists arriving from abroad for use by them temporarily for exhibition and in illustration, promotion, and encouragement of art, science, or industry in the United States, and not for sale, shall be admitted free of duty, * * *.

654. Works of art, collections in illustration of the progress of the arts, sciences, agriculture, or manufactures, photographs, works in terra cotta, parian, pottery, or porcelain, antiquities and artistic copies thereof in metal or other material, * * * for exhibition * * *, or for a municipal corporation, for the purpose of erecting a public monument, and not intended for sale * * * free of duty.

655. Works of art, productions of American artists residing temporarily abroad, or other works of art, including pictorial paintings on glass, imported expressly for presentation to a national institution or to any State or municipal corporation or incorporated religious society, college, or other public institution, including stained or

painted window glass or stained or painted glass windows imported to be used in houses of worship, * * * free of duty.

656. Works of art (except rugs and carpets), collections in illustration of the progress of the arts, works in * * *, and objects of art * * * which shall have been produced more than 100 years prior to the date of importation, * * * free of duty.

DESCRIPTION.

The various paragraphs of the act of 1913 relating to works of art are comprehensive and easy of administration, since the decisions thereunder have been concerned mainly with the proper classification of articles rather than with construction of the paragraphs themselves. The principal decisions under paragraph 376 relate to works in marble and usually hinge on the point as to whether or not the article in question is a work of art or an article of utility and a manufacture of marble. Other decisions hinge on the words "original" or "copy," and whether certain articles are properly included within the meaning of the paragraph in question.

AMERICAN ART AND THE TARIFF.

(*a*) *Development of American galleries.*—"Fifty years ago there was, I believe, only one public art gallery in America, the Dusseldorf gallery of New York, * * *; and to-day art museums are scattered all over the land, and are multiplying," said Bryan Lathrop, of Chicago, in his remarks before the committee during its hearings of 1908 on this subject. The large cities of the United States contain the principal art collections and galleries, chief among these being New York, Chicago, Boston, and Washington.

It is stated that much more than one-half of the imported art in our public museums has been acquired by the gifts or loans of private collectors. Art can not properly be regarded, therefore, as only the luxury of the rich. The imported paintings in the Metropolitan Museum of New York were valued at $5,000,000 in 1908, four-fifths of which were acquired by gifts or loans of private collectors. Nearly 1,000,000 people yearly visit this museum. It is estimated that one-half of the collection in the Corcoran gallery in Washington, in value, was presented or is loaned by private individuals. Any duty on original works of art would discourage its importation and retard the growth of American galleries. Undoubtedly the past tariff laws have kept out many valuable works of art.[1]

(*b*) *The effect of the tariff on the development of art.*—It is obvious that a tax on art is a tax on education and culture. It limits the number of art objects in the country in either public or private possession, and thus retards the study of the artists and the growth of appreciation of art by the public. The artist himself does not desire a tariff, since by limiting the imports of art he not only suffers to that extent the lack of opportunity to study works of foreign art at home, but the demand for his product is retarded by anything which hinders the growth of public appreciation of art. Protection to the artist is interpreted more as seclusion. Protection can be claimed neither to extend aid to American artists, nor to elevate the American taste for

[1] Tariff hearings, 1908–1909, pp. 7212 to 8210.

fine art. The highest development of art can only be attained through the fullest knowledge of art, both ancient and modern.

(c) *Art and industry.*—The relation of the fine arts to the industries is often not fully appreciated. The development of an artistic taste and skill is of the greatest importance to the manufacturing industries and the trades, in fact, in any field in which the products of form and design play an important part. For instance, art plays a large part in the textile industry, in the wood and metal-working industries, and in architecture and building. The ability to compete successfully with the rest of the world in the finer grades of products depends in no small degree upon maintaining artistic standards comparable with those of other nations.

DOMESTIC EXPORTS.

American exports of works of art go principally to France, Germany, England, Canada, and Italy. The total yearly value of exports before the war was about $1,000,000.

IMPORTS.

Imports into the United States of works of art come mainly from France, Germany, Italy, and England. The average yearly value of "works of art, all other" (dutiable), imported from 1905 to 1909 was somewhat over $4,000,000. The act of 1909 removed the duty on works of art over 20 years old. The value of dutiable works of art dropped to about $600,000 in 1910, while the value of "art works, all other," jumped to $18,000,000 and increased to $50,000,000 in 1913. The importation of "art works, all other," decreased materially during the war, but in 1918 their value was approximately treble that of 1909, the last year before the removal of the duty on art over 20 years old.

TARIFF HISTORY.

The act of 1883 placed a duty of 30 per cent ad valorem on works of art, except certain designated classes for special purposes. The act of 1890 reduced the duty to 15 per cent, while the act of 1894 placed art on the free list. The act of 1897 imposed a duty of 20 per cent, which the act of 1909 reduced to 15 per cent. The act of 1909 inserted the 20-year clause above mentioned, and the act of 1913 dropped this clause.

Rates of duty.

DUTIABLE.

Act of—	Par.	Tariff classification or description.	Rates of duty, specific and ad valorem.
1883....	470	Paintings, in oil or water colors, and statuary not otherwise provided for. But the term "statuary," as used in the laws now in force imposing duties on foreign importations, shall be understood to include professional productions of a statuary or of a sculptor only.	30 per centum ad valorem.
1890....	465	Paintings, in oil or water colors, and statuary, not otherwise provided for in this act. But the term "statuary" as herein used shall be understood to include only such statuary as is cut, carved, or otherwise wrought by hand from a solid block or mass of marble, stone, or alabaster, or from metal, and as is the professional production of a statuary or sculptor only.	15 per centum ad valorem.
1894....	575	Paintings, in oil or water colors, original drawings and sketches, and artists' proofs of etchings and engravings, and statuary, not otherwise provided for in this act. But the term "statuary" as herein used shall be understood to include only professional productions, whether round or in relief, in marble, stone, alabaster, wood, or metal, of a statuary or sculptor, and the word "painting," as used in this act, shall not be understood to include such as are made wholly or in part by stenciling or other mechanical process.	Free.
1897....	454	Paintings in oil or water colors, pastels, pen and ink drawings, and statuary, not specially provided for in this act. But the term "statuary" as used in this act shall be understood to include only such statuary as is cut, carved, or otherwise wrought by hand from a solid block or mass of marble, stone, or alabaster, or from metal, and as is the professional production of a statuary or sculptor only.	20 per centum ad valorem.
1909....	470	Paintings in oil or water colors, pastels, pen and ink drawings, and sculptures, not specially provided for in this section. But the term "sculptures" as used in this act shall be understood to include only such as are cut, carved, or otherwise wrought by hand from a solid block or mass of marble, stone, or alabaster, or from metal, and as are the professional production of a sculptor only, and the term "painting" as used in this act shall be understood not to include such as are made wholly or in part by stenciling or other mechanical process.	15 per centum ad valorem.
1913....	376	Works of art, including paintings in oil or water colors, pastels, pen and ink drawings, or copies, replicas, or reproductions of any of the same, statuary, sculptures, or copies, replicas, or reproductions thereof, and etchings and engravings, not specially provided for in this section.	Do.

1913	399	Works of art, painting, statuary, frescoes, and other works of art, the production of American artists. But the fact of such production must be verified by the certificate of a consul or minister of the United States authorized upon the written declaration of the artist: paintings, statuary, frescoes, and other works of art, imported expressly for presentation to national institutions, or to any State, or to any municipal corporation, or religious corporation or society.	Free.
1909	25	Works of art, the production of American artists residing temporarily abroad, or other works of art, including pictorial paintings on glass, imported expressly for presentation to a national institution, or to any State or municipal corporation or incorporated religious society, college, or other public institution, except stained or painted window glass or stained or painted glass windows; but such exemption shall be subject to such regulations as the Secretary of the Treasury may prescribe.	Do.
1894	616	Same as act of 1890 with substitution of the word "including" for the word "except" following "other public institution."	
1897	208	Same as act of 1894.	
1909	728	Works of art, productions of American artists residing temporarily abroad, or other works of art, including pictorial paintings on glass, imported expressly for presentation to a national institution, or to any State or municipal corporation, or incorporated religious society, college, or other public institution, except stained or painted window glass or stained or painted glass windows, and except any article, or whole or any part, molded, cast, or mechanically wrought from metal, within 20 years prior to importation; but such exemption shall be subject to such regulations as the Secretary of the Treasury may prescribe.	Do.
1913	655	Works of art, productions of American artists residing temporarily abroad, or other works of art, including pictorial paintings on glass, imported expressly for presentation to a national institution, or to any State or municipal corporation, or incorporated religious society, college, or other public institution, including stained or painted window glass or stained or painted glass windows imported to be used in houses of worship, and excepting any article, or whole or any part, molded, cast, or mechanically wrought from metal, within 20 years prior to importation; but such exemption shall be subject to such regulations as the Secretary of the Treasury may prescribe.	Do.
1909	111	* * * works of art, except rugs and carpets, collections illustrative of the progress of the arts, works in bronze, marble, terra cotta, parian, pottery, or porcelain, artistic architectural and scientific works of architectural character or scientific value which shall have been produced more than 20 years prior to the date of importation, but the free importation of such objects shall be subject to such restrictions as to proof of antiquity as the Secretary of the Treasury may prescribe.	Do.
1913	658	Same as act of 1909	Do.

Court and Treasury Decisions.

Paragraph 376: A bronze statue cast in a foundry by artisans from a model made in some plastic material by an artist, but upon which the artist did little or no retouching, was held not "statuary wrought by hand from metal" within the meaning of paragraph 454 of the act of 1897, but dutiable as a manufacture of metal under paragraph 193. Altman v. United States, 224 U. S., 583, of 1912.

To constitute "sculptures" under the act of 1909, the evidence had to show that the articles were cut, carved, or otherwise wrought by hand from solid blocks or masses of marble and that they were severally the professional productions of a sculptor. Downing v. United States, 3 Ct. Cust. Appls., 473, of 1912.

Under the act of 1913 "statuary" and "sculptures" are interchangeable terms. United States v. Masson, 3 Ct. Cust. Appls.,

168, of 1912, holding an artistic statue of gold bronze and ivory to be sculpture; United States *v.* Olivotti & Co., 7 Ct. Cust. Appls., 46, of 1916.)

"Works of art" within paragraph 376 does not cover the whole range of the beautiful and artistic, but only those productions of the artist which are something more than ornamental and decorative, and which may be properly ranked as examples of the free fine arts or possibly that class only of the free fine arts imitative of natural objects as the artist sees them and appealing to the emotions through the eye alone. "Sculpture" as an art is that branch of the free fine arts which chisels or carves out of stone or other solid material or models in clay or other plastic substances for subsequent reproduction by carving or casting imitations of natural objects, chiefly the human form, and represents such objects in their true proportions of length, breadth, and thickness, or of length and breadth only.

A work is not necessarily sculpture because artistic and beautiful and fashioned by a sculptor from solid marble. Utilitarian articles do not become sculpture by reason of being adorned by the carving of a sculptor unless the sculptural decorations be so compelling that the utilitarian achievement of the artisan is lost in the realized sentiment of the artist. A marble font and marble settee, the work of a sculptor, and incidentally embellished by him with artistic carvings, are not sculpture or works of art within this paragraph, but manufactures of marble under paragraph 98. (United States *v.* Olivotti, 7 Ct. Cust. Appls., 46, of 1916.)

Neither the tariff act of 1913 nor this paragraph thereof limits the definition of the word "sculptures" as used in said paragraph and the word must be given the meaning ascribed to it in common understanding. A *copy, replica, or reproduction* under this paragraph must possess the same qualities or charactersitics and must be made by a professional sculptor or under his supervision. The history of this legislation shows that Congress did not intend by enacting this paragraph as new legislation to lower the standard of work necessary to constitute sculpture or to dispense with the requirement that such work must be produced by or under the supervision of a sculptor, thereby admitting at a low rate of duty the commercial productions of artisans because of characteristics rendering them attractive, ornamental, or beautiful. *Marble parts of a temple* designed as an ornament for a yard or a garden, which are embellished or ornamented with more or less elaborately cut or carved representations of various kinds, there being no claim that they are the professional production of a sculptor, are dutiable as manufactures of marble under paragraph 98 and not under this paragraph as works of art or sculpture. If these parts are not sculpture it follows that they are not works of art under this paragraph. Having denied classification as works of art to the parts of this temple, the court refused to classify the whole temple as a work of art. (United States *v.* Downing, 6 Ct. Cust. Appls., 545, of 1916.)

Articles of utility and articles made wholly or in part by mechanical processes were held to come within paragraph 376 of the act of 1913, if they fall within the category of "works of art" as the term is broadly applied. (Dept. Order, T. D. 34438. of 1914.)

Paragraph 611: Plaster statuary, the professional production of a sculptor, but not original, and suitable for use only as a model, was

held free of duty under this paragraph rather than dutiable as manufactures of plaster of Paris under paragraph 369. (Abstract 42185, of 1918.)

Plaster of Paris casts of sculpture, imported for use as matrices from which to mold reproductions, are models within the meaning of this paragraph granting free entry to "statuary and casts of sculpture for use as models or for art educational purposes." (G. A. 7632, T. D. 34905, of 1914.)

Curtains and draperies for use on or about an altar of a church, classified under paragraph 358, were held not to be free of duty as regalia under this paragraph, nor as works of art under paragraph 655. (Abstract 37203, of 1915.)

A censer, benitier, and pair of burettes, the only articles in the importation carried in the hand during the services of the church for which they were imported, were held free of duty as regalia under paragraph 661 of the act of 1909. The protest was overruled as to all other items in the importation. (Abstract 26391, T. D. 31832, of 1911.)

The right of free entry of regalia can not be abridged by administrative regulations, and a regulation requiring that proof should be produced at the time of entry was held not to make dutiable regalia shown by evidence offered to the collector before liquidation to be within paragraph 649 of the act of 1897. (Siegman *v.* United States, 141 Fed. 491, of 1905.)

Funeral palls used to decorate or place over the casket in church at a funeral and carried to and from the casket by hand, often folded into a small bundle for convenience, were held not to come within paragraph 611 of the act of 1913. (Abstract 43704, of 1920, following Abstract 35806, T. D. 34548, of 1914.)

ORIGINAL WORKS OF ART.

Where *paintings* have been admitted free of duty, the frames on these, when framed, have, by a long course of practice in the customs, recognized by law, been dutiable, and where paintings are dutiable and are imported in frames these frames are not integral parts of the pictures and can not be deemed containers either in themselves or by the rule ejusdem generis. The pictures and the frames are separable for tariff purposes. (Kunfeld *v.* United States, 5 Ct. Cust. Appls., 222, of 1914.) *Pen and ink or pencil drawings* colored with water colors, made on paper by artists working under direction of a master artist, used as originals for making plates to illustrate women's wearing apparel in dress catalogues and magazines, are classable as "original drawings and sketches in pen and ink or pencil and water colors" under this paragraph and not dutiable as manufactures of paper. A sketch or drawing is not taken outside the meaning of the word "original" in this paragraph by the fact that it is the result of the combined concurrent efforts of several artists. The provision in this paragraph for "original drawings and sketches in pen and ink or pencil and water colors" is narrower than the provision in the same paragraph for "original paintings in * * * water, or other colors." (9 Ct. Cust. Appls., T. D. 38046, of 1919.) An appeal is pending from Abstract 43063, of 1919, involving a somewhat similar issue. *Pen and wash drawings* were held entitled to free

entry as original drawings under this paragraph. (Abstract 37944, of 1915.) *Chinese water color paintings bound in book form* were found to be original paintings and works of art and held free under this paragraph. (Abstract 42334, of 1918.) The provision for "statuary * * * wrought by hand * * * from metal" in paragraph 454 of the act of 1897 does not include a bronze statue cast in a foundry by artisans from a model that was made in plastic material by an artist, but upon which he did but little or no retouching. (224 U. S., 583, of 1912.) Among articles excluded from the paragraph are: *Parts of fountains* in the shape of two bronze figures cast by the cire-perdue process from metals made by professional sculptors and the castings finished by professional sculptors, held dutiable under paragraph 376, they not being shown to be originals or first or second replicas within the meaning of this paragraph (G. A. 8196, T. D. 37785, of 1918); and *marble statues* executed by professional sculptors from sketches or photographs furnished to them, though artistic and considered works of art, not being original sculptures within this paragraph, since sculpture to be original must be the work of the artist from its conception or creation in the mind of the artist until its completion in its material form (G. A. 8220, T. D. 37863, of 1918). *A portrait done in oil which was a copy or replica* of a portrait by the same painter, it being held to be not an original painting in oil but a copy, replica, or reproduction, and the paragraph providing for original paintings only (G. A. 7199, T. D. 37792, of 1918), and *oil paintings in the form of panels* of various sizes intended for the decoration of a wall of a room, held not to be originals (Abstract 42612, of 1918), were held dutiable under paragraph 376 as works of art. A *marble bench* with base and top of single pieces of slabs or marble, as an original sculpture to be free under the paragraph must also be a work of art (G. A. 8134, T. D. 37514, of 1918), and small *marble busts and statuettes* produced in a commercial way (Abstract 42613, of 1918) were held dutiable as manufactures of marble or of alabaster. A *bronze statue* cast by the cire-perdue process from an original model made in terra cotta by Rodin, the casting being carved, remodeled, and improved by the artist, was held free of duty under this paragraph as an original sculpture cast in bronze and the professional production of a sculptor. (G. A. 8229, T. D. 37898, of 1919.) Vases, plaques, and ornaments, mineral painted, the original work of an artist, and having no utilitarian purposes, are free of duty under this paragraph as paintings in mineral colors. "Mechanical process" should be interpreted under the rule of ejusdem generis as relating to a mechanical process of like kind as stenciling, that is to say, a process for producing the representation or artistic effect and not a process for fixing more permanently the production of the artist. "Firing" of a painting on earthenware is not a "mechanical process" within the meaning of the paragraph. (Wells Fargo *v.* United States, 8 Ct. Cust. Appls., 125, of 1917.)

Original sketches in pen and ink or pencil and water colors were held exempt from duty under paragraph 652 of the act of 1913, although the water colors were laid on with a brush and such sketches may be articles of utility. (G. A. 8331, T. D. 38368, of 1920.)

Drawings and sketches are entitled to free entry under paragraph 652 only when they are (1) originals and (2) when the colors thereon

have been made with water colors. Such drawings may be sketched with pen and ink or with pencil; they must, however, also contain color produced by water color; hence, pencil drawings or sketches on paper of patterns and designs intended to be used in lace making are excluded from said provision because merely pencil drawings containing no water colors. (G. A. 8371, T. D. 38501, of 1920.)

WORKS OF ART FOR PUBLIC COLLECTIONS, ETC.

When *pictures* are admitted free of duty under bond for exhibition, the frames are also entitled to free entry. (T. D. 33728, of 1913.) *Furniture*, imported by the Ohio State Archæological and Historical Society, for permanent exhibition at the home of the late President Hayes at Fremont, Ohio, was held not to be free of duty under this paragraph. The home was deeded to the State of Ohio, with a life estate reserved to President Hayes's children and grandchildren, in whose possession it was being used as a private residence and not open to the public. (G. A. 8259, T. D. 38030, of 1919.) The principal purpose of the *Olympic Club* is to encourage athletics, and to do this a regular corps of teachers is employed to give systematic physical instruction. Such an institution is engaged in educational work and a *statue artistic in character*, imported for exhibition in the club, was held to fall within the terms of paragraph 715 of the act of 1909, and entitled to free entry. (United States *v.* Olympic Club, 5 Ct. Cust. Appls., 251, of 1914.)

Articles imported for exhibition in the Red Cross Museum are exempt under paragraph 654 of the act of 1913. (T. D. 38320, of 1920.)

An importation made by a contracting company who received pay for the same from a general fund made up of contributions can not be said to have been imported expressly for presentation. Parts of an altar, even though produced by a professional sculptor, which require changes and extensive and elaborate work and material from domestic sources to complete the altar, can not be said to be works of art as imported. A Roman Catholic church organized primarily for religious service has been held by the Board of General Appraisers not to be an educational institution within the meaning of paragraph 654 of the act of 1913. (G. A. 8360, T. D. 38465.) An appeal is pending in the Court of Customs Appeals.

WORKS OF ART THE WORK OF UNITED STATES CITIZENS AND STAINED GLASS WINDOWS FOR PRESENTATION.

The legislative history of that portion of this paragraph that relates to *painted or stained glass windows* shows clearly, and the language itself must be taken to show, that it is a complete and independent provision in no wise modified or affected by the clause of exclusion in the paragraph. Houses of worship are those designated as beneficiaries in importing free of duty painted or stained glass windows, and they are so entitled whether incorporated or not. (Perry *v.* United States, 6 Ct. Cust. Appls., 201, of 1915.) *Pieces of painted or stained glass*, intended for use in repairing painted or stained glass windows already in churches, are not dutiable under the provision of paragraph 95 for "stained or painted glass windows, or

parts thereof," but are free of duty under this paragraph as "stained or painted window glass * * * imported to be used in houses of worship." (G. A. 8005, T. D. 36893, of 1916.) *Stained glass panels*, 2 feet long and 1 foot wide, imported for presentation to Wellesley College, are not entitled to free entry under this paragraph as "works of art * * * including pictorial paintings on glass, imported expressly for presentation to a * * * college." (G. A. 7856, T. D. 36165, of 1916.)

ANTIQUITIES.

Article 395 of the Customs Regulations of 1915, providing that the importer of antiquities shall furnish a certificate stating from whom the merchandise was acquired and the date of its acquisition, is reasonable. A certificate stating that antiquities were acquired "from various persons" on different dates of the years 1914 and 1915 is not a compliance therewith. (United States *v.* Tsai, 9 Ct. Cust. Appls., 42, of 1919.)

Chairs, upholstered in tapestry, classified as manufactures in part of wool, claimed to be free as artistic antiquities as to the upholstery, were held not separable for dutiable purposes. (Abstract 38885, of 1915, following G. A. 7203, T. D. 31492, of 1911.) The Treasury Department has held that when articles are composed in *part of artistic antiquities* and in *part of modern portions* not rendering them works of art, such parts, when capable of being appraised and reported on separately, are to be treated separately for classification purposes. (T. D. 37394, of 1917.) Since this decision the rulings have not been entirely uniform; as *table spreads, centerpieces, and other articles made of lace and embroidery*, partly antique and partly modern, were held not separable so as to permit the antique portion to be admitted free of duty (G. A. 8115, T. D. 37446, of 1917); also *pillow slips* or *covers* made principally of silk with embroidered and gold lace decorations, the embroidered silk in the face of the article being over 100 years old and the gold lace and fringe modern, were held, as imported, not to be an artistic antiquity (Abstract 43306, of 1919). But as to an importation of certain *portions of the walls of a room* taken from an old house in England (Kilburn Grange), claimed to be made in the time of Charles the Second, together with certain modern additions and restorations, returned as an entirety, it was held that the modern additions and restorations are dutiable and the balance free as antiques (Abstract 42942, of 1919); and *modern wooden settees and antique tapestry covers* cut and shaped to fit the frames of the settees, but not attached thereto, itemized separately on the same invoice, were held not entireties and to be treated separately, the settees dutiable as furniture and the antique tapestries free under this paragraph (G. A. 8285, T. D. 38109, of 1919). In another case under this paragraph various articles of furniture, some of which had been repaired, among other ways with replacement of parts, such as new legs, were held exempt from duty as having been "produced more than 100 years prior to the date of importation." (United States *v.* Shallus, 7 Ct. Cust. Appls., 314, of 1917.) *Parts of a house* imported to be used in the construction of another house in this country, though antique and the house in its original surroundings interesting and possibly artistic,

were held not free under this paragraph. (G. A. 8114, T. D. 37435, of 1917.)

Porcelain vases, candlesticks, and lamps, classified as articles of decorated china, chief value, at 55 per cent ad valorem under paragraph 80 of the act of 1913, were classified as follows: Bowls and vases, with metal attachments intended to make them look like or useful as lamps or like fixtures, all of the porcelain and decorated china being admittedly artistic and made 100 years before importation, with the metal parts invoiced and packed separately, were held separable for duty purposes; the porcelain part was held free of duty, and the metal part as manufactures of metal. (Abstract 43556, of 1920.)

Tapestry which was originally the border of a hanging and had been made into furniture covers has lost its identity as an antiquity by the addition of new material; and labor and velvet, although admittedly more than 100 years old, which had been artistically embroidered, has also lost its identity as an antique. Free entry under paragraph 656 was denied. (Abstract 43673.)

A room consisting of four walls constructed in the main of antique material, but not shown to have existed in the form imported as a room 100 years previous to importation, was held not exempt from duty under paragraph 656. (G. A. 8335, T. D. 38383, of 1920.)

Screens composed of wood frames and silk, the most part of the silk being artistic and antique and consisting of silk trimmings, are not free under paragraph 656 nor dutiable under paragraph 318 as articles composed in chief value of silk, but are dutiable as articles made in whole or in part of trimmings under paragraph 358. (G. A. 8340, T. D. 38412, of 1920.)

A rate of duty sufficient to reimburse the Government for the heavy expenses incurred might be advisable if duty for revenue should not be imposed upon the articles enumerated in this paragraph. Apart from the work in the collector's office, 8 to 10 examiners and from 25 to 30 employees at New York devote a large part of their time to the examination of such importations. Every importation has to be examined in its entirety, and occasionally experts are called in to assist the examiners in determining the question of antiquity.

A definite date instead of 100 years might be inserted in the law: 1820 would be especially appropriate for furniture and might be applied also to other articles enumerated in the paragraph.

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and Index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for, and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and Index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Guy G. George and Charles F. Yauch, of the Commission's staff, and of others.

MUSICAL INSTRUMENTS AND PHONOGRAPHS.

SUMMARY.

The musical instrument industry in the United States has developed mainly since 1850. The essential and distinctive features of the modern piano were introduced in the United States, and the reed organ is almost wholly an American product. The phonograph was invented and developed in the United States.

The value of the products of the industry in 1849 was about $2,000,000, and in 1914 the total value of the products of the musical instrument industry, including phonographs, was approximately $120,000,000. Nearly 50,000 wage earners were employed in 1914 and 326,274 pianos, 42,806 organs, and 514,154 phonographs were produced. There were 737 establishments engaged in the industry, capitalized at a total of about $170,000,000. The States of New York and Illinois produced 59.4 per cent of the total value of pianos and organs in 1914, while New Jersey was by far the leading State in the manufacture of phonographs.

Foreign competition in the case of pianos, organs, and phonographs has been almost negligible. Imports have been mainly supplementary rather than competitive in the past. The native wood used in the American piano is said to be one of its great permanent advantages. In the foreign market only the high-grade American piano or phonograph can be sold in competition with other makes, but the American reed organ is sold very extensively in all parts of the world. When the sale of a piano or phonograph depends mainly upon the price rather than upon the quality, the foreign instrument almost invariably finds a more ready sale than the American.

The tariff rate on musical instruments was 45 per cent ad valorem from 1897 until 1913, when it was reduced to 35 per cent.

Summary table.

GENERAL INFORMATION.

ACT OF OCTOBER 3, 1913.

PAR. 373. Musical instruments or parts thereof, pianoforte actions and parts thereof, cases for musical instruments, pitch pipes, tuning forks, tuning hammers, and metronomes; strings for musical instruments, composed wholly or in part of steel or other metal, all the foregoing, 35 per cent ad valorem.

PAR. 374. Phonographs, gramophones, graphophones, and similar articles, or parts thereof, 25 per cent ad valorem.

DESCRIPTION.

The principal classes of musical instruments manufactured in the United States are pianos, with and without player attachments; organs, reed and pipe; piano and organ materials; and phonographs and records. There are also a variety of instruments and materials manufactured under the class known as "Musical instruments and materials, not specified," which include wind and string instruments of many varieties.

Importations of foreign instruments of the principal classes above mentioned have been so small as to be almost negligible. The statistics of imports do not disclose the individual items, but it is quite certain that they consist mainly of violins, other stringed instruments, orchestrions and accordions, and small instruments requiring a great deal of hand labor or special skill in their manufacture.

DOMESTIC PRODUCTION.

Size and importance of the industry.—In 1914 there were 737 establishments, capitalized at a total of approximately $170,000,000, engaged in the manufacture of musical instruments or parts thereof and phonographs. Nearly 50,000 wage earners were employed, and the value of the products was only a little less than $120,000,000.

Materials, equipment, and methods of production.—Piano manufacture has become standardized to a great extent, the same style piano of different factories usually possessing but few distinguishing external characteristics other than the name on the fall board.

The first and one of the most important steps in the manufacture of a high-grade piano is the selection and seasoning of the wood. The wood used is almost entirely of American growth, the only notable exceptions being the ebony for the black keys and the expensive woods for veneers. "Just as Italian and Tyrolese forests made Amati violins possible in Cremona, so American lumber has made it possible to bring piano making to its highest perfection in this country."[1] The seasoned wood is usually glued together under pressure so as to effect a permanent joint. Very few metal bolts or screws are used in the framework, as they are liable to work loose. Both tonal quality and strength are secured by gluing the parts.

The metal plate is a casting of great strength, and its manufacture is an important step in the making of a piano. The sounding board

[1] Census of Manufactures, 1902, Part IV, Vol. X, p. 454.

is made from carefully selected spruce pine. The wire must be of great elasticity. The laying out of the scale and the arrangement of the wire and the action or striking mechanism require expert ability.

In the manufacture of reed organs practically all of the materials are strictly American products, even the ivory and ebony formerly used for the keys now being supplanted by celluloid and a stained wood. Very little expensive veneer is used. The manipulation of the tongue of the reed to a proper size and curve and the determining of the size of the reed cells, and qualifying cells, when such are used, are the most delicate of the operations involved in its manufacture.

The primary operation in the construction of a pipe organ, and that of the most importance, is the construction of the pipes. They are made of wood or metal, and require the greatest skill in voicing and tuning. The bellows or electric fan for furnishing the wind must be made to correspond to the size of the organ. The action of the keys is now usually electric.

Both the metal parts entering into the mechanism of the phonograph and the wood for the cabinets or cases are entirely American materials, excepting expensive veneers for the cabinets. The waxlike materials entering into the construction of the records are also entirely produced in the United States.

Organization.—There is a great tendency in the industry toward the corporate form of ownership with large factories having a high capitalization. In the piano and organ branch of the industry in 1914, 67.4 per cent of the total number of establishments, 92.5 per cent of the average number of wage earners, and 91.8 per cent of the value of products were controlled by corporations, the corresponding percentages for 1909 being 61.9, 86.1, and 85.7, respectively. Establishments whose annual output was valued at $100,000 or more turned out 90 per cent of the value of products in 1914 and 88.8 per cent in 1909. There were 478 establishments reported in this branch of the industry in 1914, with a total capitalization of $130,989,794 making the average capitalization of each about $270,000. This branch of the industry represents about 76 per cent of the capitalization of the entire musical instrument industry.

The form of ownership of establishments manufacturing musical instruments and materials not specified is not given by the census, but the average capitalization of the 241 establishments in 1914 was about $16,000 each. In 1909 there were 187 establishments reported, with an average individual capitalization of approximately $18,000. This branch of the industry has shown considerable fluctuation in the number of establishments, but the total capitalization and the total value of the products have both remained practically constant since 1899 at approximately $3,500,000. This branch of the industry represented only about 3 per cent of the total value of the products of the entire industry in 1914.

The character of ownership of the phonograph branch of the industry is not available, but it is known that a number of the principal manufacturers are large corporations. The capitalization of the 18 establishments reported in 1909 and 1914 increased from over $14,000,000 to approximately $34,000,000, which represented an average capitalization in 1914 of nearly $2,000,000 for each firm. The value of the products increased from $12,000,000 to $27,000,000 during the same period, and the number of persons engaged increased from 5,928 to 11,366.

Geographical distribution.—Pianos, organs, and materials: Based upon the value of products, the first four States for the years 1914 and 1909 were New York, Illinois, Massachusetts, and Connecticut. New York produced 37.2 per cent of the total in 1914, and Illinois produced 22.2 per cent. The two States combined produced nearly three-fifths (59.4) of the total value of products in 1914. The next six States, following the four enumerated above, were Indiana, Ohio, New Jersey, Michigan, Pennsylvania, and Wisconsin.

Musical instruments and materials, not specified: The three leading States in 1916, based upon value of products, were Indiana, Illinois, and New York. In 1909 they were New Jersey, Illinois, and Indiana. New Jersey dropped to fifth place in 1914. In both years the three leading States together reported more than one-half of the total value of products. Other States in 1914 were Massachusetts, Michigan, and Pennsylvania.

Phonographs: Both in 1914 and 1909 New Jersey was, by far, the leading State, measured by value of products, followed by Connecticut and New York in the order named.

History of the industry.—The development of the industry has taken place almost entirely since the year 1850. It is also true that the most important inventions have been applied since that time. Just what effect the various tariff rates may have had upon the development of the industry is difficult to determine, but the facts do not seem to indicate that its development is traceable so much to the tariff rates as to the improvements in the manufacture of the instruments and the growth of the market for them.

The value of the products of the industry has shown a remarkable but steady increase since 1849. In round numbers the values of the products of the combined industry for the census years are as follows: 1849, $2,000,000; 1859, $7,000,000; 1869, $14,000,000; 1879, $19,000,000; 1889, $37,000,000; 1899, $47,000,000; 1904, $80,000,000; 1909, $105,000,000; 1914, $120,000,000. The imports in 1872, the first year musical instruments were separately reported, amounted to only 7.6 per cent of the domestic production as reported in the nearest census year, and they declined to 4.8 per cent of the domestic production in 1880. There was no duty placed on musical instruments until 1883, when a duty of 25 per cent ad valorem was imposed. Foreign competition had evidently little effect upon the early development of the industry, and in this 30-year period from 1849 to 1879 the yearly value of the products had increased from $2,000,000 to $19,000,000, without any protection afforded by the tariff.

The imports in 1890 amounted to 4.6 per cent of the domestic production, practically the same as in 1880, but both the imports and domestic production had nearly doubled in value since the year 1880. Some of the most important improvements in piano manufacture were being put into use during this 10-year period, and the market for instruments was no doubt expanding in a manner corresponding with the development of their manufacture. There was a tariff of 25 per cent ad valorem in effect during this period.

In 1890 musical instruments were not enumerated in the tariff act, but in 1894 the duty of 25 per cent was restored and in 1897 it was raised to 45 per cent. However, the increase in the value of the domestic products under this protection was only about $10,000,000 for the 10-year period 1889 to 1899, while in the previous 10-year period the increase had been nearly $20,000,000.

The growth of the phonograph industry has taken place since the year 1890, and the player-piano industry has developed mainly since 1895. The value of products of the entire industry in 1904 clearly indicates this development, since in the 5-year period from 1899 to 1904 there was an increase from $47,000,000 to $80,000,000, and this total jumped to $105,000,000 for the 10-year period ending in 1909. The yearly importation remained practically constant, although the percentage decreased to about 2 per cent of the value of domestic products. The tariff rate remained at 45 per cent from 1897 until 1913, when it was reduced to 35 per cent.

Domestic production and consumption.—Production by States for recent census years will be found in the statistical tables. The value of the products of the combined industry was given above. The small importation of about $1,000,000 annually is made up mainly of instruments and materials which supplement the home product and do not furnish serious competition to it. The increase in the value of exports, amounting to over $9,000,000, in 1918 would seem to indicate that the domestic production is sufficient to meet the demand of the home market and furnish a surplus.

Domestic exports.[2]—Domestic exports of the combined industry increased from a total value of $5,870,951 in 1914 to $9,599,628 in 1918. This amount in 1918 was almost evenly divided between musical instruments and phonographs. The following table shows the distribution of exports for the two fiscal years:

	1914		1918	
	Number.	Value.	Number.	Value.
Musical instruments:				
Organs	8,457	$555,743	2,330	$139,706
Player-pianos	1,219	335,299	3,545	1,095,665

Phonographs	.....	2,512,320	91,217	2,610,866
Records and accessories	.....	.....	.....	2,073,463
Total value	.....	5,870,951	.....	9,599,628

[1] Not stated separately prior to 1915.

The destination of exports has changed noticeably in the past few years, probably due to the war. England and European countries have taken decreasing amounts; in some cases exports to European countries have entirely ceased. On the other hand exports to Cuba, Mexico, and the Central and South American countries have greatly increased. Australia was the leading purchaser of the exports of pianos in 1918, taking very nearly one-half of the total. Canada has been and remains one of the principal buyers of all classes of instruments exported from the United States, and took approximately one-half of the exports of phonographs and materials in 1918.

The American piano and player-piano are quite generally considered to be superior instruments in all markets, especially the highest

[2] "Foreign Trade in Musical Instruments," Special Consular Reports, No. 55, 1912.

grade American piano, but its sale in foreign markets is largely restricted to the purchaser to whom expense is not the primary consideration, as it is generally higher priced than its competitors. The high Canadian tariff restricts the sale of American pianos in that country, but in several districts its sale amounts to 35 per cent or more of the total sales. In general, about 80 to 90 per cent of the South American piano market was supplied, before the war, by Germany. Although the American piano was highly regarded as to quality, it was too high priced and was not built to conform to the tastes of the purchaser in such matters as ornamentation and finish, size and weight, and method of packing for shipment. The same criticisms apply to the American piano in other fields. Before the war the American piano met keen competition in practically all foreign fields, and generally was not able to compete with the German and French product, especially the former, except in the high-grade instruments.

The American phonograph seems to have fared better than the piano in the foreign market, and it almost completely dominates the market for phonographs in the Western Hemisphere. It is also extensively sold in the European market and elsewhere, although it meets keen German competition.

The American export of organs and wind and string instruments is not so extensive, but Canada furnishes a good market for a considerable export. The American reed organ is still in good demand in some foreign countries and is generally able to compete successfully with other makes, but the demand is steadily declining. The American brass and wind instruments can not generally compete successfully with other makes in the foreign market.

Undoubtedly the exports of musical instruments would be greater were it not that piano and organ manufacturers have in some instances found it more advantageous to establish branch factories abroad, to carry out the ideas and methods of American production gauged to suit the requirements of the foreign trade, thus saving duties and obtaining the advantage of less expensive labor.

FOREIGN PRODUCTION.[3]

Available material on foreign production of musical instruments is very meager. Germany is the principal foreign manufacturer, especially of pianos. In 1912 it was estimated that there were 150 piano manufacturers in Berlin, whose annual production was about 10,500 pianos. The total number manufactured in Germany would no doubt exceed this many times. Commerce Reports, November 24, 1919, page 1098, states that the number of pianos exported from Germany in 1913 was 76,460. Based upon the number of pianos exported, it is quite clear that the total number manufactured in Germany before the war was large. The United States manufactured 326,274 pianos in 1914 and exported 8,846. Germany is entirely dependent upon foreign sources for its supply of cabinet woods, which has been cut off during the war. One German manufacturer of phonographs claims an annual output of about 200,000 instruments, but many of these are of the cheaper grades. Germany is the principal exporter of musical instruments to the United States.

[3] "Foreign Trade in Musical Instruments," Special Consular Reports, No. 55, 1912.

The United Kingdom exported 10,692 pianos of domestic manufacture in 1911, but imported 19,215. According to the census of 1911, there were 5,622 male piano and organ makers in London. Based upon the number of wage earners employed, the annual output is estimated at about 30,000 pianos. Talking machines and records to the value of $335,788 were manufactured in the United Kingdom in 1907. However, in 1912, it was reported that the bulk of the trade in phonographs was of German origin. Many of the high-grade phonographs were imported from the United States. There were 3,832 organs imported into the United Kingdom in 1910, and 915 of domestic manufacture were exported. There is not much trade in organs. Wind instruments to a value of $355,354, and string instruments to the value of $72,997 were manufactured in the United Kingdom in 1907, and the demand was said to be increasing.

France produced about 25,000 pianos annually before the war. Germany exported several hundred pianos annually to France, generally pianos of the cheaper grades, and sold them under the name of the local dealer in France. France exported about 4,000 pianos annually. France exported phonographs in 1910 to a value of $779,391, while imports were valued at only $141,095. The number of instruments manufactured, however, is not known.

Italy manufactured about 1,500 pianos annually before the war and imported 4,434 in 1910, of which 3,707 were imported from Germany. The average value of the imported piano was about $130 each. The demand for phonographs was pretty well supplied before the war by German manufacturers.

Russia manufactured about 6,000 pianos annually before the war, and imported 4,501 in 1910.

Canada manufactures about 20,000 pianos annually and imported 1,697 in 1911. Canada imports phonographs largely from the United States, but manufactures her own organs.

In comparison with these figures of foreign production the United States produced 326,274 pianos in 1914, 42,806 organs, 514,154 phonographs, and musical instruments not specified to a value of $3,624,667.

IMPORTS.

Reference to table of imports shows a slight increase from year to year in the value of imports of musical instruments, until the beginning of the war, reaching their highest point in 1914, with a total value of about $2,000,000. The domestic production in that year of the combined industry totaled $120,000,000. Imports thus represented only about 1.6 per cent of the value of domestic products.

As the imports are not classified it is difficult to determine their contents. However, it is quite certain that they do not consist of the products of the principal branches of the industry in this country, i. e., pianos and organs and phonographs. The value of imports has remained practically constant in amount since the year 1872, at a little over $1,000,000 in value, with a small increase in recent years but a decrease in comparison to the value of domestic products. This fact leads to the conclusion that the imports are mainly supplementary to the domestic products, as previously stated.

PRICES.

Satisfactory price comparisons are not available, but, as indicated in the discussion of domestic exports, whenever the American piano comes into competition in the foreign market with the German or French piano it is usually undersold, when price is the primary consideration. The consular agents reported in 1912 that a German piano sold in many markets for little more than $100. A price of $130 for the cheap piano was common. Such a piano could probably pay the freight and duty charges to the United States and still undersell the cheapest American piano. The fact is, however, that this piano is not the equal in quality or durability of the cheapest American pianos. A large local dealer in pianos asserts that there need be no fear of competition from the cheaper foreign pianos, whatever their price.

TARIFF HISTORY.

The rate imposed in 1883 was 25 per cent ad valorem. The act of 1890 did not enumerate musical instruments, but the act of 1894 restored the duty of 25 per cent, and the act of 1897 raised the duty to 45 per cent, where it remained until the act of 1913, when it was reduced to 35 per cent.

Phonographs were first enumerated in 1909, when a duty of 45 per cent was imposed. This was reduced to 25 per cent in 1913.

The fluctuation in the tariff rates apparently produced no noticeable fluctuation in the value of imports. Certain it is that the ratio of the value of imports to the value of domestic products began decreasing before any tariff on imports was imposed and has continued to decrease from year to year, irrespective of any changes in the tariff rates.

COMPETITIVE CONDITIONS.

The value of products of the musical instrument and phonograph industry in 1914 reached a total of approximately $120,000,000. The total value of imports of musical instruments and phonographs in the same year was $2,228,172. The ratio of imports to domestic production has been constantly decreasing, from 7.6 per cent in 1872 to less than 2 per cent in 1914. The following is a recent statement of one of the leading manufacturers of pianos, organs, and phonographs, located in Chicago:

> We believe that importation of foreign instruments such as we manufacture has been in the past so small as to be negligible.

There is no doubt that many of these instruments can be manufactured more cheaply in Germany and other foreign countries, but the quality and durability of the instruments are not such as to offer serious competition to the high-grade American instruments, especially in the case of pianos, organs, and phonographs. One of the great advantages possessed by the foreign manufacturer is a lower labor cost, and labor is one of the chief items of cost in this industry. On the other hand, the American woods used in piano manufacture are said to be superior to the foreign.

The tariff has not been of great importance in the growth of the American industry, since the cheaper foreign instruments could have

been imported and sold more cheaply than the American-made instruments in spite of the tariff. It is only logical to conclude that the cheaper grades have found a better market in other countries, and that the higher grades of foreign instruments fail to compete successfully in the American market. However, Mr. George W. Pound testified before the Committee on Ways and Means (Tariff Hearings, 1908–9, p. 7190–7201) that foreign competition had entirely driven the American orchestral or band organ out of the market. Such is certainly not the case with pianos, organs, and phonographs, which constitute the principal classes of instruments manufactured in this country.

Formerly it was considered that the American brass and wind instruments were much inferior to the imported, but these are now being manufactured extensively in this country and are considered by dealers to be the equal if not the superior of the foreign made.

TARIFF CONSIDERATIONS.

The present rate of 35 per cent on musical instruments and 25 per cent on phonographs has not brought any criticism from the manufacturers in reply to letters of inquiry sent out by the Tariff Commission. Manufacturers of violins, however, request a separate classification and a higher rate of duty for their product.

VIOLINS.

DESCRIPTION.

Stringed instruments played with a bow are made in a number of sizes, the smallest of which is the violin. The next larger is the viola, called alto or tenor, followed in order by the violoncello and double bass. All are of the same general model. The violin is usually made in three sizes—half and three-quarter sizes for children and full size, which is the most common. Violins are made practically of the same woods and of the same size and shape as they were 300 years ago in Italy. The Amati and Stradivarius models are still followed.

MATERIALS.

The woods used in making an American violin are the various species of maple found in Wisconsin, Michigan, and Ohio for the back, sides, and neck, and Oregon and Washington spruce for the top. The best maple is that which possesses a "curl" occurring in freak trees. Curly maple is scarce and consequently the greater proportion of violins is made of slightly curled or plain wood. All maple and spruce are quarter sawed to secure the "flame effect" of the curl of the maple and the narrow even grain of the spruce. Both woods must be air dried and aged for months.

METHODS OF MANUFACTURE.

The manufacture of violins is almost entirely wood carving.

Tops and backs are usually made from one piece of wood. The wood is split and the corresponding edges joined to show exactly the same symmetrical grain on both sides of the center line. This

is especially true in the use of curly maple. Backs and tops are carved, both inside and out, to the exact model desired and the thickness carefully graduated. The tone quality of a violin depends to a considerable extent on accurately proportioning the thickness of wood in all parts.

Machines are used for removing the bulk of the wood from tops and backs and spindle carriers for the necks. Only the rough work can be done in this way, as the accurate work in shaping and finishing the complex curved surfaces can be done only by actual handwork. It is claimed that the overdoing of machine carving caused the failure in 1920 of one company engaged in the manufacture of commercial violins.

The edges of the top and back are purfled, that is, a three-layer, very narrow strip of black-and-white wood is inlaid near the edge, which gives a double black line. The inlay for the top and back is composed of 30 pieces.

The neck scroll is carved by hand and is an example of the skill required. Sides, consisting of six pieces, together with side linings, neck and end blocks, the bass bar, neck, finger board, nut and tailpiece nut are carefully fitted and strongly glued together. After the parts are sanded and final finishing touches given by hand carvers, the instrument is ready to receive the varnish. Varnishing and rubbing operations are repeated several times, depending on the grade of the instrument.

In the final assembling, the end pin for tailpiece and pegs are fitted and inserted, and the tailpiece, tail gut, strings, and bridge are added. In all there are about 80 separate pieces. The instrument is then ready for tuning and testing. It is not until the final test discloses the quality of tone, dependent upon the resonant quality of the wood and workmanship, that the value of the instrument can be determined. It may be worth a few dollars or several hundred.

DOMESTIC PRODUCTION.

In 1914 the census reported 135 establishments, with a capital of $992,679, employing 495 wage earners, engaged in the manufacture of violins and other stringed instruments. The total product was valued at $1,142,149. The statistics do not show what proportion of the product was violins.

Violins have been made for many years in America by individuals in small shops. The Violinists' Guide Book gives the names of 385 individuals making from 1 to perhaps 20 annually. It is estimated that the output of violins by individuals will amount to 5,000 annually.

Up to the beginning of the war, very few violins were made on what may be termed a commercial scale. Manufacturers of other small musical instruments endeavored to supply the demand, but it is stated by a manufacturer that the care necessary and the cost of handwork made it impossible to compete with the foreign instruments, and that three companies, all having had experience in the trade, and manufacturing violins exclusively, have, within the past 15 months, gone into bankruptcy, due to the large shipments of the accumulated European stocks and the increasing shipments from Japan.

It is further stated by the manufacturer that there are three concerns still in business, each of which produce 3,000 or more violins annually. These three concerns, together with individual makers and musical instrument dealers who manufacture for their own trade employ about 1,500 people and produced about 65,000 violins in 1920.

FOREIGN PRODUCTION.

The industry in Italy is centered at Cremona, where were produced the celebrated violins of the sixteenth and seventeenth centuries.

Violin making is prominent in the Mittenwald and Markneukirchen districts of Germany.

There have been practical schools in Germany for many years where this peculiar and specialized trade is learned. The work is usually done in the homes, the several members of the family making such parts as their individual skill and age will permit. It appears to be the custom for families to specialize in making certain parts. The various parts are then assembled and the violins varnished and finished in a central place.

Wood carvers in Japan turned their activities to violin making several years ago and on account of their long experience in the art, they were able to copy the work with ease and produce violins of excellent quality.

IMPORTS.

The value of imports is not stated in official statistics. It is stated by a manufacturer who bases the data on the importation of four dealers that prior to the war imports came from Germany, Italy, and France and that the total importations amounted to 300,000 violins annually. Of these Germany shipped 150,000 to 175,000, Italy 75,000 to 100,000, and France 50,000 to 75,000. Shipments from Japan increased during the war as a result of a shortage in the United States of the European stock. Violins imported prior to the war were of various grades. It is stated that the retail price on some was as low as $1.25 to $3 each.

COMPETITIVE CONDITIONS.

Domestic manufacturers state that prior to the war all low and medium priced violins and most of the higher grades were imported from Germany, Italy, and France.

The fact that a violin is made in a foreign country adds greatly to its value in the eye of the average purchaser, as the impression has been created that American manufacturers are not able to supply good instruments. The claim of age for many foreign-made instruments also gives them a decided advantage over American makes.

It has been pointed out by an American manufacturer that first place was voted to a modern-made instrument in a test made by a celebrated cellist before well-known musicians and critics in Paris, and that a similar test with respect to violins resulted in favor of the modern instrument.

The prejudice in favor of the imported instrument has been somewhat overcome by domestic manufacturers, as a result of a greater use of American-made violins during the war, when the supply from Europe was cut off.

American manufacturers in the last three years have had to meet the competition of Japanese violins, which up to the present time have been of good tone and quality.

TARIFF CONSIDERATIONS.

Manufacturers of violins ask that their product be given a separate classification and rate in the tariff. They state that violins occupy a necessary position in the musical world; that they do not compete industrially or musically with any other instrument; that the product of European countries is made by workers skilled in the craft for generations and whose meager living expense is supplied by very low wages.

They further state that 95 per cent of all the violins sold in America were made abroad; that no low or medium priced instruments for beginners, known as commercial violins, were made here prior to the war, and that they constitute fully 75 per cent of the demand; that it was not until the war had eliminated European shipments were they able to begin manufacture on a commercial basis; that labor constitutes over 70 per cent of an average violin's cost.

[1] Not available.

[4] In addition, in 1914, phonographs, graphophones, and parts, valued at $66,531, and in 1909, valued at $31,899 were made by establishments engaged primarily in the manufacture of products other than those covered by this industry designation.

[6] States: "New York was the only State in 1914 for which statistics could be given separately without disclosing the operations of individual establishments, but the industry in New York was not of sufficient importance to present data in detail for this State. The value of the products of the 5 establishments located in New York was $160,603, or less than 1 per cent of the total for the country. Of the remaining 13 establishments reported in 1914, 4 were located in New Jersey; 3 in Illinois; 2 in Connecticut; and 1 each in Delaware, Massachusetts, Ohio, and Pennsylvania."

Imports of musical instruments and phonographs, by countries (fiscal years).

Court and Treasury Decisions.

Musical instruments.—A musical instrument has been declared to be "an implement or structure artificially constructed and ordinarily used for the production of a succession of musical and harmonious sounds, or the completed indispensable parts of such structure or implements, artificially constructed which are practically indispensable in the art of music, and which are constructed and ordinarily used for the production of musical and harmonious sounds." (G. A. 8177, T. D. 37680, of 1918.) It is no part of the definition of a musical instrument that it can be used to produce a continuous melody and that a chromatic scale can be played upon it (United States *v.* Sears, Roebuck & Co., 7 Ct. Cust. Appls. 60, of 1916); nor is it necessary to its classification as a musical instrument that the article shall be capable of producing a complete tune (U. S. *v.* Sears, Roebuck & Co., 9 Ct. Cust. Appls. ——, T. D. 37875, of 1918). The following among other articles, have been held to be musical instruments: Triangles of metal with a wooden-handled hammer or striker (United States *v.* Sears, Roebuck & Co., 7 Ct. Cust. Appls. 60, of 1916); cymbals (Abstract 43345, of 1919); jew's-harps (U. S. *v.* Sears, Roebuck & Co., —— Cust. Appls., ——, T. D. 37875, of 1918); castanets (T. D. 37368, of 1917); and wooden fish and brass gongs and wooden beaters (Abstract 43345, of 1919); but upon a fuller record, wooden fish, a block of hard wood having two deep narrow cavities carved therein so arranged and shaped that when struck successive blows with a hard instrument, as a hammer, it emits noises resembling the trotting of a horse on a hard pavement, was held not be a musical instrument (G. A. 8177, T. D. 37680, of 1918); also brass gongs (Abstract 40319, of 1916); and small wooden whistles known as "baby crys," used in orchestras or moving-picture shows to produce a sound like the crying of a baby (G. A. 7387, T. D. 32777, of 1912). "Parts of musical instruments" include violin and cello necks, unserviceable in the condition in which imported for any other use than as parts of musical instru-

ments (United States *v.* Lyon & Healy, 4 Ct. Cust. Appls. 438, of 1913); music rolls for a player piano known as the Welte Mignon (Welte & Sons *v.* United States, 5 Ct. Cust. Appls. 164, of 1914); organ keyboard case, although placed 20 feet from the closest part of the organ (Abstract 37318, of 1915); drum heads (United States *v.* Lyon & Healy, 4 Ct. Cust. Appls. 84, of 1913); violin bows (Abstract 39112, of 1916); violin finger boards, necks, pegs, and bridges (Richard & Co. et al. *v.* United States, 4 Ct. Cust. Appls. 470, of 1913); but does not include hollow, cylindrical wood and ivory not shown to be confined to use as parts of musical instruments (United States *v.* Lyon & Healy, 4 Ct. Cust. Appls. 438, of 1913), and violin mutes, which are composed of steel and used on the bridge of a violin to soften or deaden the sound (Abstract 38839, of 1915).

"Strings for musical instruments," provided for in this paragraph and paragraph 366, refers to strings used for the production of musical sounds and includes strings of the proper length designed for use in the production of musical tones upon certain musical instruments (Fischer *v.* United States, 5 Ct. Cust. Appls. 301, of 1914); and small catgut strings of different gauge or diameter, some from 45 to 68 inches in length and others from 23 to 45 inches, ready for immediate use as strings for musical instruments (Richard & Co. *v.* United States, 3 Ct. Cust. Appls. 306, of 1912). But strings composed of catgut wound with silk, silk chief value, are not included, but are dutiable under paragraph 318 as a manufacture in chief value of silk. (Fischer *v.* United States, 6 Ct. Cust. Appls. 443, of 1915.)

Phonograph disks are parts of phonographs within this paragraph (American Express Co. et al. *v.* United States, 4 Ct. Cust. Appls. 279, of 1913), as are needles for phonographs (Landay Bros. *v.* United States, 5 Ct. Cust. Appls. 498, of 1915). A phonograph motor complete with the exception of a mainspring, but ready for use in connection with other articles or parts of the phonograph outfit, was held to be a part of a phonograph within this paragraph (Abstract 42372, of 1918), but disks of soft wax, known as master records, in themselves neither intended for nor susceptible of use as parts of phonographs, graphophones, or gramophones, were held not within this paragraph, nor exempt from duty as models of improvements in the arts under paragraph 629, but dutiable under paragraph 462 as manufactures of wax (G. A. 7182, T. D. 31351, of 1911). Mica washers for gramophones are parts of gramophones. (Abstract 36977, of 1914.)

Under the act of 1883, when parts of musical instruments were not specially provided for, ivory piano keys were held dutiable as manufactures of ivory.

Under the act of 1890, musical instruments were classified according to the component material of chief value.

VIOLIN ROSIN.

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this, industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act, reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index," the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Guy G. George, of the Commission's staff, and of others.

MASKS.

General Information.

1913 TARIFF PARAGRAPH.

Par. 370. Masks, of whatever material composed, 25 per cent ad valorem.

DESCRIPTION AND USES.

A mask may be defined as a covering or partial covering for the face, used for a disguise.

PRODUCTION, IMPORTS, AND EXPORTS.

There are no statistics available for domestic production nor for domestic exports. Imports are not stated by countries, but imports for consumption are given. Imports have only exceeded a total value of $10,000 in the fiscal years 1914 and 1915, while in other years they have been much less than $5,000 yearly (except in 1916, when they amounted to $5,688).

TARIFF CONSIDERATIONS.

There is no information available which leads to an indication of a tariff problem. The duty has varied from 25 per cent ad valorem to 35 per cent ad valorem.

Masks—Imports for consumption—Revenue.

Fiscal year.	Rate of duty.	Quantity.	Value.	Duty collected.	Value per unit of quantity.	Actual and computed ad valorem rate.

Paragraph 371, act of 1913, 25 per cent ad valorem. (For treatment see par. 272.)

MOSS AND SEAWEEDS.

SUMMARY.

It is estimated that about 700 cars, or about 14,000,000 pounds of domestically produced eelgrass, commonly called sea moss, are used annually in the United States, and in addition about 100 cars, or 2,000,000 pounds, of Canadian sea moss. The principal uses of this sea grass or sea moss are for mattress making and upholstery. Small amounts are used for wiping in the furniture trade, and larger amounts are used in paper making, probably about 2,000,000 pounds.

The domestic supply is collected during the summer along the New Jersey coast near Barnegat Bay. It is dried on the beach and put up for shipment in bales of about 200 pounds each, and loads about 20,000 pounds to the car.

The price in 1914 of domestic sea moss was $17.50 a short ton, f. o. b. New York. European sea moss, principally from Belgium and the Netherlands, sold in 1914 for $9.30 a long ton, f. o. b. New York.

Canadian sea moss has been selling for $10 to $15 a ton higher than the American product. It is collected along the St. Lawrence River.

The other principal class of moss included under paragraphs 372 and 552 is commonly known as "Irish" moss. In Japan it is called "kanten." It is collected to some extent in the United States along the New Hampshire and Massachusetts coasts, but it is not known that the collection is carried on as a commercial enterprise. The growth of kanten in Japan is quite an extensive industry. It is also collected along the rocky shores of the British Islands and continental Europe. It is used in the manufacture of food products—to thicken soups, jams, jellies, and ice cream—also in distilleries as a clarifying agent, in making sizing in the textile industry, in tanning, in the manufacture of medicines used in the treatment of throat and pulmonary affections, and in other ways. However, it is evidently not used in large quantities in the United States, since neither the import figures nor the statements of dealers indicate a large consumption of it.

Moss and seaweeds—Summary table.

Year.	Imports for consumption.[1]	Domestic exports.	Value (imports for consumption).[2]	Amount of duty.	Value per unit of quantity.
1910	$214,203	$81,314	$88,155	$8,816	([3])

[1] Free and dutiable combined.
[2] Dutiable imports only.
[3] Value per pound in 1909=$0.154.
[4] Exports of moss only after 1917, as seaweed is not stated separately after that year.
[5] Calendar years.
[6] 6 months ending June 30, 1921.

General Information.

1913 TARIFF PARAGRAPHS.

PAR. 372. Moss and sea grass, eelgrass, and seaweeds, if manufactured or dyed, 10 per cent ad valorem.

PAR. 552. Moss, seaweeds, and vegetable substances, crude or unmanufactured, not otherwise specially provided for in this section. Free.

DESCRIPTION AND USES.

The term "moss" covers a class of small herbaceous plants, being generally applied to a number growing together in a mass. The title is also popularly extended to similar growths of other types, particularly to some lichens and seaweeds.

Among the mosses valuable as food, the best known are Iceland moss, a lichen, Ceylon moss (kanten), and Irish moss (carragheen), the last two being seaweeds. "Moss" or "sea moss" farina is a prepared granulated food in which lichen or seaweed is the principal ingredient.

Iceland moss is a nutritious lichen gathered chiefly in Norway and Iceland, where it is often dried, ground into flour, and made into bread. Elsewhere it is generally made into a decoction or jelly and as such is considered a valuable article of diet for invalids and children and a useful and popular demulcent and emollient in throat and pulmonary affections. It contains about 80 per cent of lichen starch.

Kanten, otherwise known as Japanese gelatin, vegetable isinglass, agar agar, is prepared in great quantities in Japan from the Gelidium family of seaweed. It is pearly white, semitransparent, tasteless, and odorless, and is marketed in stick and block form—"slender kanten" and "square kanten." On analysis it shows about 60 per cent carbohydrates and 7 per cent protein.

Kanten is used by the Japanese in the preparation of jellies and soups and for clarifying saki or rice spirit. The kanten which is exported to the United States and Europe is used in the manufacture of food products—to thicken jams, jellies, and ice cream; in distilleries, and in the textile, silk, and other industries. Under the name of agar agar it is used in making culture media in bacteriological work.

Bengal isinglass, Ceylon moss, and Chinese moss are similar related products.

Gelidium seaweed grows abundantly on the Pacific coast of the United States and at some points along the Atlantic, and apparently offers a good opportunity for the manufacture of domestic vegetable isinglass.

Carragheen, Irish moss, or pearl moss, is a species of edible seaweed named after the town of Carragheen, near Waterford, Ireland. It is found on the coast of the British Islands, the rocky shores of continental Europe, and the eastern shores of the northern United States and Canada.

The carragheen of domestic use is obtained principally from New Hampshire and Massachusetts, the harvest season there extending from May to September. After gathering, the plants are washed in salt water and spread on the beach to dry and bleach, the process being repeated several times.

As marketed, carragheen is in pieces of from 2 to 3 inches to 1 foot in length, cartilaginous and flexible in texture, branching in shape, and in color from a reddish brown to straw color or white, varying with local differences in the plant and the extent of the bleaching. Formerly the greater part of the supply was employed in the clarifying of beer. It is used in the manufacture of food products similarly to kanten. It is also used by tanners in finishing leather and in the manufacture of oils.

Eelgrass or sea grass is a submerged plant with very long and narrow leaves which grows in abundance in shallow bays along the North Atlantic coast. It is also called barnacle grass and grass wrack. Sea grass is now used extensively in the upholstering business in place of excelsior, tow, jute fiber, and Florida grass. The season for gathering the grass is short, and the nature of the work necessitates the employment of experienced baymen. The grass is put up for market in bales of about 200 pounds.

DOMESTIC PRODUCTION.

It is estimated that about 600 cars, or 12,000,000 pounds, of sea moss of domestic production is consumed annually by the mattress and upholstery makers, while the paper makers use from 2,000,000 to 4,000,000 pounds. It is also estimated that Canadian moss to the amount of about 100 cars, or 2,000,000 pounds, is used annually in the United States. It is collected along the St. Lawrence River.

It is not known how much domestic Irish moss is collected, but it is thought that the quantity is not large, inasmuch as dealers report handling only small amounts.

Since imports are not segregated, it is impossible to determine whether they consist of Irish moss or eelgrass. However, it is known that the principal importation of Irish moss is from Japan and France, while eelgrass comes mainly from Canada, the Netherlands, and Belgium.

The domestic production of eelgrass is carried on quite extensively, but it is not known that there is any commercial collection of domestic Irish moss. There is practically no export. It appears, therefore, that imports and domestic products are both consumed. One of the dealers in eelgrass states that the supply is not sufficient to meet the demand.

DOMESTIC EXPORTS.

Domestic exports of seaweeds are very small, the highest value for the years recorded in this survey being $48,180 in the fiscal year 1913. Exports are now included in "All other articles."

FOREIGN PRODUCTION.

Production and preparation of seaweed in Japan.[1]—Between Yokohama and Tokyo, along the electric car line and not far distant from the seashore, there were to be seen in February very many long, fence-high screens extending east and west, strongly inclined to the north, and built out of rice straw, closely tied together and supported on bamboo poles carried upon posts of wood set in the ground. These screens, set in parallel series of five to ten or more in number and several hundred feet long, were used for the purpose of drying varieties of delicate seaweed, * * *.

The seaweed is first spread upon separate 10 by 12 inch straw mats, forming a thin layer 7 by 8 inches. These mats are held by means of wooden skewers forced through the body of the screen, exposing the seaweed to the direct sunshine. After becoming dry the rectangles of seaweed are piled in bundles an inch thick, cut once in two, forming packages 4 by 7 inches, which are neatly tied and thus exposed for sale as soup stock and for other purposes.

To obtain this seaweed from the ocean small shrubs and the limbs of trees are set up in the bottom of shallow water, * * *. To these limbs the seaweeds become attached, grow to maturity and are then gathered by hand. By this method of culture large amounts of important foodstuff are grown for the support of the people on areas otherwise wholly unproductive.

The Statistical Yearbook of Japan gives the production of "Kanten" for the year ending March, 1916, as 3,703,650 pounds, valued at $1,239,374; and in 1917 as 3,065,225 pounds, valued at $1,182,028.

IMPORTS.

Imports of unmanufactured moss and seaweeds have been much greater than imports of manufactured or dutiable moss and seaweeds. Imports of unmanufactured moss were valued at $127,008 in 1910 and $478,361 in 1920. The average value has been about $200,000 since 1910.

Imports of manufactured or dyed moss and seaweeds were valued at $89,802 in 1910, $54,376 in 1914, and $7,367 in 1918.

Imports of unmanufactured moss came principally from Canada, Japan, Germany, France, and British South Africa. Manufactured moss came principally from Germany, France, Japan, and the Netherlands.

PRICES.

In 1914 eelgrass from the Netherlands and Belgium sold at $9.30 a long ton f. o. b. New York. Domestic eelgrass sold for $17.50 a short ton f. o. b. New York. The wholesale price of domestic sea moss in 1919 was $35 a ton. It is predicted that the 1920 price will be $37.50 a ton in car lots, and $40 a ton in less than car lots. It is predicted that the 1920 price of Canadian moss will be $60 a ton.

TARIFF HISTORY.

The act of 1894 imposed a duty of 10 per centum ad valorem on sea moss or Iceland moss. The duty has remained the same since that time, but the wording of the provision has been changed. In

[1] Extract from "Farmers of Forty Centuries," by F. H. King. 1911

1897 sea moss alone was named. In 1909 the act added sea grass, eelgrass, and seaweeds, if manufactured or dyed. The act of 1913 made no change with respect to moss and seaweeds.

The acts of 1890, 1894, 1897, 1909, and 1913 exempted from duty "moss, seaweeds, and vegetable substances, crude or unmanufactured, not otherwise specially provided for."

COMPETITIVE CONDITIONS AND TARIFF CONSIDERATIONS.

The domestic producer of eelgrass faces competition at the present time from Canada. Since Canadian eelgrass sells, or it is predicted that it will sell in 1920, for $20 a ton more than domestic eelgrass, it would not appear that the two articles are exactly comparable, nor that they supply the same demand.

Since there is no known commercial production of Irish moss, this item presents no tariff problem.

1913	552	Moss, seaweeds, and vegetable substances, crude or unmanufactured, not otherwise specially provided for in this section.	Free.

COURT AND TREASURY DECISIONS.

Paragraph 372.—Moss dyed, prepared for florists' use and for ornamental purposes, was held not exempt under the act of 1894 as crude moss. (G. A. 3146, T. D. 16317; G. A. 3384, T. D. 16956, of 1895.) Sea moss which had been dyed for the purpose of preserving its natural form and color, such dyeing not changing its name or character, was held to come within the provision for sea moss in paragraph 81 of the act of 1897. (G. A. 6464, T. D. 27670, of 1906.) Wreaths made of natural rock moss, dyed and prepared, were held dutiable as moss manufactured or dyed under the act of 1909. (Abstract 26020, T. D. 31744, of 1911.)

Paragraph 552.—The term vegetable substances as used in paragraph 552 of the act of 1913 was interpreted not to be limited to articles that are strictly ejusdem generis with moss and seaweeds, and birch bark in the condition as stripped from the tree was held not to come within the provision and to be dutiable as an unenumerated unmanufactured article. (Reed *v.* United States, 5 Ct. Cust. Appls., 95, of 1914.) Lily of the valley roots in bunches and in part having sprouts or crowns thereon, imported for forcing, were also held not to be exempt as vegetable substances but to come within the provision for "Lily of the valley and other plants used for forcing under glass for cut flowers," etc. (McAlester *v.* United States, 147 Fed., 773.) Seaweed carrageen, known as Irish moss, was held dutiable as sea moss. (G. A. 3459, T. D. 17078, of 1896.) Sea grass used in the manufacture of mattresses and for upholstery purposes, etc., was held exempt from duty as vegetable substances and not dutiable as sea moss. (G. A. 5480, T. D. 24788, of 1903.) Seaweeds, dried, known as nori and hashinori, with nothing added to change their character, and packed in tin boxes as a convenient method of getting the products to market, were held exempt from duty as crude seaweeds and not dutiable as vegetables by reason of being edible. (United States *v.* Ohashi, 7 Ct. Cust. Appls., 487 and 495, of 1917; United States *v.* Furuya, G. A. 8272, T. D. 38072, of 1919; G. A. 8273, T. D. 38073, of 1919; G. A. 8339, T. D. 38411; Abstracts 43600, 43710, 43711, 43720, and 43721, of 1920.)

Natural sun bleached wheat stems and heads, tied into small bundles, for use as semifloral ornaments or emblems, are exempt from duty under this paragraph as a crude or unmanufactured vegetable substance, or under paragraph 497 as textile grasses or fibers, and not dutiable under paragraph 385 as unenumerated manufactured articles. (United States *v.* Rice, 9 Ct. Cust. Appls., 165, of 1919.) But customs officers were instructed by the Treasury Department to continue the assessment of duty on such articles, pending a furthe judicial determination of the matter. (T. D. 38025, of 1919. Bleached wheat and ruscus leaves were subsequently held by the Board of General Appraisers exempt from duty. (Abstracts 43871 44025, and 44027, of 1920.) Merchandise invoiced as grass strings' and classified as manufactures of grass under paragraph 368 were held exempt from duty under this paragraph as crude vegetable substances. (Abstract 41292, of 1917.) Musgo was held exempt as a moss. (Abstract 38787, of 1915.) Dried sea moss, known as asakusa nori, was held exempt from duty as a crude seaweed, and

not dutiable as a prepared vegetable; following G. A. 8272, T. D. 38072, and G. A. 8273, T. D. 38073. (T. D. 38411, of 1920.)

Dried stypa grass and avoine in a natural state were held to come within paragraph 552 of the act of 1913 because of judicial construction of prior acts impliedly approved by Congress in reenacting the law. (United States *v.* Post, 3 Ct. Cust. Appls., 260, of 1912.) Horseradish roots are vegetable substances unmanufactured rather than vegetables for tariff purposes. (United States *v.* Wallace, 4 Ct. Cust. Appls., 142, of 1913; United States *v.* Nix, 4 Ct. Cust. Appls., 145, of 1913.)

Merchandise invoices as coconut parings, used in the manufacture of coconut oil, classified as waste under paragraph 384 of the act of 1913, were held exempt from duty as a crude vegetable substance under paragraph 552. (Abstract 43972, of 1920.) Rice bran, shorts, and middlings, by-products in the scouring or cleaning of rice, come within paragraph 385 of the act of 1913 as unenumerated articles and not within paragraph 552. (G. A. 8121, T. D. 37471, of 1917; affirmed without opinion, T. D. 38242, of 1918.)

PEAT MOSS.

GENERAL INFORMATION.

1913 TARIFF PARAGRAPH.

PAR. 377. Peat moss, 50 cents per ton.

Peat moss is a dry, fibrous, matted substance taken from the surface of a peat bog. It is a sanitary stable dressing, noncombustible, and acts as a deodorant. It is used in the manufacture of stuffing for horses' hoofs. It may also be used as stuffing for mattresses.

Peat moss is imported almost wholly from the Netherlands, although a little is imported from Germany and Belgium. Great fields of it are found in certain districts of the Netherlands. It extends from the surface of the earth to a depth of 6 to 10 feet, and under the moss peat is found to a depth of 12 feet. The fields are drained of water, after which the moss is taken out in blocks with spades and brought to the factories in flatboats. It is then dried and pressed into bales weighing about 200 pounds each.

There is no known domestic production of peat moss. An attempt was made to manufacture peat moss for stable purposes at Garrett, Ind., but that project is reported to have been abandoned. In the tariff hearings of 1897 it was claimed that a peat-moss industry could be built up in Wisconsin if sufficient protection against the foreign product was granted. A tariff of $1 per ton was imposed in 1897 and retained until 1913, and yet no industry manufacturing peat moss for the purposes indicated had been developed. It was reported that the Wisconsin moss was being used in paper making.

Before the war the average yearly importation amounted to about 8,000 tons, valued at from $5 to $6 per ton. It was stated before the Committee on Ways and Means that the amount imported before duty was imposed on peat moss was about 15,000 tons yearly. The revenue derived from the import is very small.

1909	471	do	Do.
1913	377	do	50 cents per ton.

Court and Treasury Decisions.

Under the act of 1883 before specific provision was made, peat moss was at first held dutiable as an unenumerated unmanufactured article (T. D. 5782, of 1883), but in 1899 the Circuit Court of the Southern District of New York held that it was exempt from duty under the provision for crude nonedible mosses. (Strohmeyer *v.* Magone, T. D. 21545.)

The provision for peat moss in the act of 1897 was held by the Board of General Appraisers to include moss fiber picked by hand from peat and used for filling mattresses. (G. A. 4535, T. D. 21545, of 1899.)

PENCILS AND PENCIL LEADS.

SUMMARY.

The war has left the American pencil industry in a very favorable condition. Exports for the calendar year 1920 reached a total value of $3,849,221, while imports were valued at $225,578. The exact increase in production since the last census is not known, but has been quite large. The value of products of the industry in 1914 was $8,328,000, while exports in that year amounted to only a little over $500,000. The increase in exports alone would account for a large increase in domestic production.

There were 14 establishments engaged in pencil making in 1914, capitalized at $16,670,000, and employing an average of 4,330 wage earners. Thirteen of the fourteen establishments were corporations. Of the total number of wage earners, 53.5 per cent were women, 44.5 per cent were men, and 2 per cent were under 16 years of age. New York and New Jersey each had 4 establishments; Pensylvannia, 2; Rhode Island, 1; Kansas, 1; Illinois, 1; Georgia, 1.

The industry has developed mainly since 1890, when the value of products for the first time exceeded $1,000,000. The United States has abundant supplies of graphite suitable for making pencil leads, and is one of the principal sources of pencil cedar. An American-owned Mexican mine furnishes an excellent grade of fine-grained graphite.

The American manufacturer of pencils is not now suffering serious competition. Germany, regarded as the most serious competitor before the war, is not now in a favorable competitive position. Her stocks of cedar are depleted and new supplies are difficult to secure. The output has been curtailed on account of the lack of fuel, shorter hours of work, higher wages, and decreased production per hour. White woods are being used and the quality of the product is poor. This situation is no doubt only temporary, but it will be some time before the German pencil makers can fully recover. Imports from Germany before the war were not over $300,000 in value, except in the year 1914, when that amount was slightly exceeded. Total imports for consumption in 1914 reached a high mark of $627,957.

Japan is beginning the manufacture of pencils, but the quality of the product has not been such as to attract the American trade. Danish pencils of good quality are being imported in small quantities, but their price is equal to the American prices, if not higher. Pencils from L. & C. Hardtmuth, now of the new Republic of Czechoslovakia, are being received in small quantities. They sell on the basis of established quality and reputation and their status would probably not be much affected by changes in the tariff, unless the rates were made prohibitive.

[1] Census of 1909. [2] Calendar year.

General Information.

Tariff paragraphs of 1913:

378. Pencils of paper or wood, or other material not metal, filled with lead or other material, pencils of lead, 36 cents per gross, but in no case shall any of the foregoing pay less than 25 per cent ad valorem; slate pencils, 25 per cent ad valorem.

379. Pencil leads not in wood or other material, 10 per cent ad valorem.

DOMESTIC PRODUCTION.

Size and importance of the industry.—In 1914 there were 14 establishments engaged in the manufacture of lead pencils, capitalized at $10,670,000, employing 4,330 wage earners, and producing an output valued at $8,328,000.

Materials.—The principal materials used in the manufacture of lead pencils are graphite and clay, used in making the lead, and cedar, used for making the cases. The United States is favored with an abundant supply of graphite of suitable quality for this use, which is found in several States. An American-owned Mexican mine, which produces an excellent grade of amorphous or fine-grained graphite, augments the supply found in the United States. The United States is one of the principal sources of cedar used in pencil making.

Colored pencils are made of chalk, clay, or wax, mixed with coloring pigments. Indelible or copying pencils are made from a mixture of graphite and aniline coloring matter.

Methods of production.—Pencil leads are made from a mixture of carefully graded fine-grained graphite and the finest clay. The hardness of the pencil depends upon the amount of clay used, but for the medium grade the proportions are about 7 parts of clay to 10 parts of graphite, by weight. The wet mixture is ground between stones many times, in order to eliminate the grit from the leads. After grinding, the water is forced out of the mixture by pressure until it becomes a thick dough. It is then pressed through dies or small holes the shape and size desired for the leads, and after being dried and cut into lengths is packed into crucibles and burned for several hours.

The wood used, which is usually cedar, although pine or other wood is sometimes used for the cheaper grades of pencils, is cut into little

slabs of pencil length and usually of sufficient width for the halves of six pencils. The slabs are smoothed and grooved to receive the leads by the pencil manufacturer. The leads are then placed in the grooves and the two strips are glued together. The united strips are dried and then cut into separate pencils, after which they are polished, varnished or painted, stamped, and packed for shipment, practically all of this work being carried on with the aid of mechanical equipment. The lead is also sometimes inclosed in paper.

Except in the lead making, the various processes in pencil manufacture are largely automatic and are carried on with machinery. More women than men are employed. The following table shows the percentage of men, women, and children employed as wage earners for comparative census years:

Year.	Per cent of total wage earners.		
	Men.	Women.	Under 16 years of age.
1914	44.5	53.5	2.0
1909	41.8	50.9	7.4
1904	41.8	52.4	5.7

Organization.—The corporate form of ownership predominated in the pencil industry in 1914, 13 of the 14 establishments reported being corporations, capitalized at a total of $16,670,000, or an average individual capitalization of $1,282,000.

Geographical distribution.—New York and New Jersey each have 4 of the 14 establishments manufacturing lead pencils. Other States with the number of establishments reported in 1914 were: Pennsylvania, 2; Rhode Island, 1; Kansas, 1; Illinois, 1; Georgia, 1.

History of the industry.—The present method of manufacturing lead pencils by mixing the graphite with clay was originated by Conté, a Frenchman, about 1800. The process was really perfected by the Germans. The manufacture of lead pencils was first established in the United States by representatives of the Fabers, of Germany, in 1861. In 1865 two other American pencil companies were established. The Joseph Dixon Crucible Co. attempted the manufacture of pencils as early as 1830, but did not meet with success at that time. However, in 1872 they again undertook the manufacture of pencils and met with success. As elsewhere stated, the necessary materials for pencil manufacture are found in abundance in the United States.

Domestic production and consumption.—There has been a steady growth in the value of products of the industry, as shown by the following table:

Census year.	Establishments.	Value of products.	Census year.	Establishments.	Value of products.
1860	6	$20,400	1900	7	$2,222,276
1870	8	180,000	1909	11	7,379,000
1880	4	279,427	1914	14	8,328,000
1890	5	1,627,560			

During the years immediately preceding the war the value of imports and exports practically balanced, at about 5 to 7 per cent of value of domestic products. Exports since the war have increased by leaps and bounds, from a value of $533,944 in 1914 to $2,748,129 in 1918. It is quite evident that domestic production is fully able to supply the domestic demand.

Domestic exports.—Exports of pencils and pencil leads have grown from a value of $380,315 in 1910 to $2,748,129 in 1918 (fiscal years), with the greater part of the increase occurring since the beginning of the war. Exports for the calendar year 1920 reached a total value of $3,849,221, while the value of imports was $208,527. Germany, the principal competitor of the United States, was cut off from her export trade during the war.

Exports from the United States went to England, Canada, the South American countries, and Australia. Nearly one-half of the value of exports in 1918 ($1,015,487) went to England alone, and $383,271 went to Canada.

FOREIGN PRODUCTION.

The import figures appear to indicate that pencils came principally from Germany and England. The pencils coming from England were, however, no doubt mostly transshipped from Austria, since it has been commonly recognized that L. & C. Hardtmuth have been the principal exporters to the United States, and since the import figures do not show large imports from Austria.

Japan is now undertaking the manufacture of pencils, and some pencils are made in Denmark. The quality of the Japanese pencils has not yet reached a high enough standard to cause much competition. Danish pencils are of good quality, but cost about the same or a little more than comparable American pencils.

The latest information from Germany leads to the conclusion that it will be a long time before her pencil makers can again offer serious competition. Cedar stocks are depleted and white woods are being used. The cedar is secured from the United States. German factories are short of fuel, wages have increased, and shorter hours of work prevail, with less production per hour, and the prices have increased from 300 to 600 per cent. Orders are taken only on the basis of prices at the time of shipment.

The "Kohinoor" pencils, made by L. & C. Hardtmuth, formerly of Austria, but now of the new Republic of Czechoslovakia, sell on the basis of quality and reputation and compete only with the very highest-priced goods. Their competition is not so much feared as that of the lower-priced German pencil. They have not been available to the American trade in large quantities since the war began.

IMPORTS.

Imports were practically constant in value during the years preceding the war, at about $500,000 annually, increasing to $642,998 in 1914. Since 1914 they have fallen off, until the value in the fiscal year 1918 was only $6,085. Imports for the calendar year 1920 were valued at $208,527.

Imports have come principally and almost entirely from Germany and England, in about equal amounts. However, the imports from England were no doubt largely transshipped from Austria.

PRICES.

Prices of domestic pencils are available, but there are scarcely any quotations available on foreign pencils, since almost none are being imported. The price of good quality imported pencils from Denmark is about the same as or a little higher to the dealer than American pencils of equal quality. German and Japanese pencils do not compare in quality with American, and are not being bought at the prices quoted. German pencils at the present time are made mainly of white woods and are not to be compared with her prewar pencils. It is stated by an American manufacturer, who returned from Germany about the end of the year 1919, that prices in Germany have advanced 300 to 600 per cent. Wholesale prices of American pencils have increased about 25 to 40 per cent over the prewar price.

TARIFF HISTORY.

Pencil leads have been assessed for duty since 1883 at 10 per cent ad valorem, except under the act of 1909. They were made dutiable at specific rates by that act at three-fourths of 1 cent per ounce for black lead, 1½ cents for colored lead, and 2 cents for copying lead.

Lead pencils were assessed for duty by the acts of 1883 and 1890 at 50 cents per gross and 30 per cent ad valorem. The act of 1894 omitted the specific rate of 50 cents per gross and assessed imports at 50 per cent ad valorem. The acts of 1897 and 1909 changed the rate to 45 cents per gross and 25 per cent ad valorem. The act of 1913 imposed a duty of 36 cents per gross, but in no case less than 25 per cent ad valorem.

COMPETITIVE CONDITIONS AND TARIFF CONSIDERATIONS.

The present situation appears to be quite favorable to the American pencil manufacturer. Imports for the calendar year 1919 were valued at $35,118, while exports reached a total value of $3,565,347. Before the war imports and exports practically balanced, with imports in excess of exports. The American export business has expanded remarkably since the beginning of the war, due no doubt to the fact that German exports to foreign markets were cut off.

German competition was the most serious prior to the war. At present the best information obtainable from Germany in December, 1919, leads to the conclusion that it will be quite a long time before German pencil makers can recover from the effects of the war. Prices have increased on pencils from 300 to 600 per cent, and orders are taken only on the basis of prices which may prevail at the time of shipment.

The principal causes for the enormous increase in prices for German pencils are given as follows: Stocks of cedar, which come from the United States, are depleted and the necessary import license to obtain new supplies is difficult to secure. The fuel situation has permitted plants to operate only part time. Wages have increased enormously, and hours of work have been reduced to eight a day, with a half day on Saturday, and the output per hour has decreased. Alder and pine are being used in place of cedar and these make a poorer quality pencil.

Japan has begun the manufacture of pencils, but so far the quality of the product has not been such as to offer serious competition in the American market.

Danish pencils of good quality are imported, but the price is not favorable.

"Kohinoor" pencils, made by L. & C. Hardtmuth, now of Czechoslovakia, are not now being imported in large quantities. They compete directly with the highest grade pencils, but not so much with the common pencils which make up the bulk of the trade. They sell on the basis of quality and established reputation.

The Pencil Manufacturers' Association has submitted a statement to the Tariff Commission containing proposed revisions of the paragraphs relating to pencils and pencil leads, of which the following are here noted:

PARAGRAPH 378, PENCILS.

(1) Pencils "not metal" should be omitted, and if lumber crayons or carpenters' pencils are intended by this term, they should be so specified or stated as mechanics' pencils. The suggested wording for the first part of the paragraph is: "Pencils of paper, wood, or other material, filled with lead or other material, and mechanics' pencils, * * *."

(2) The words "slate pencils" are not necessary if pencils in wood or paper are intended, since they would be included in the wording as it now stands. If slate pencils not in wood are intended, they should be so stated. It is suggested that slate pencils be included in paragraph 379.

(3) In addition to rates on pencils, the statement suggests that there should be levied certain cumulative duties: Caps or protectors whether separate or attached to pencils, pencils prepared for caps or protectors, and pencils stamped with names other than the manufacturer's. Just what is meant by a name other than the manufacturer's is not stated, but it would appear to prohibit the use of trade names on pencils, substituting therefor the maker's name. Concrete evidence that such increases in duty are required is not available and has not been submitted upon request of the Tariff Commission by the Pencil Manufacturers' Association.

(4) Substitute for paragraph 379: "Slate pencils not in wood, —— per centum ad valorem; pencil leads, if colored or black, —— per ounce and —— per centum ad valorem; copying —— per ounce and —— per centum ad valorem."

The argument presented by that association in support of a higher rate on pencil leads is that the duty on pencil leads ought to be increased in proportion to the duty on aniline, milori blue, vermilion, etc. The present rate on leads is 10 per cent ad valorem. The highest duty ever assessed on pencil leads was by the act of 1909 as follows: Black, three-fourths cent per ounce; colored, 1¼ cents per ounce; and copying, 2 cents per ounce.

The specific duties of the act of 1909 were objected to on the ground that they resulted in an exorbitant equivalent ad valorem duty, many times the former duty of 10 per cent ad valorem, and that it was an attempt to stifle the pencil makers who imported their leads.

COURT AND TREASURY DECISIONS.

Wood-covered slate pencils were held dutiable as slate pencils and not as pencils of wood under the act of 1890, which, like the act of 1913, imposed one rate of duty on all slate pencils. (G. A. 2582, T. D. 15005, of 1894; G. A. 3826, T. D. 17951, of 1897.)

Crayon pencils were held dutiable as pencils of wood and not as crayons. (G. A. 2722, T. D. 15221; In re Blumenthal, 49 Fed., 226, of 1892.)

Soap pencils intended for cleaning spectacles and eyeglass lenses have been held not to come within the provision for pencils of paper or wood, filled with lead or other material, and pencils of lead, etc., but dutiable as unenumerated manufactured articles. (United States *v.* American Express Co., 136 Fed., 594, of 1905.)

Fancy pencils of wood filled with lead, having fitted at one end a diminutive crooked handle resembling the handle of a cane and upon the other end a metal cap protecting the point, have been held dutiable as lead pencils. (G. A. 6006, T. D. 26245, of 1905.)

In reenacting in successive tariff acts in substantially the same words the provision for lead pencils, Congress sanctioned the administrative and judicial construction which rated them and their holders separately for dutiable purposes. Wooden lead pencils with metal holders are accordingly not dutiable as entireties; the pencils come within this paragraph, but the holders as metal articles under paragraph 167. (United States *v.* Borgfelt, 7 Ct. Cust. Appls., 367, of 1916.) Pocket pencils of metal and celluloid, in chief value of celluloid, were held dutiable at 25 per cent under this paragraph. (Abstract 39209, of 1916.)

Small red cylindrical sticks, a mixture of clay and grease with a lake consisting of oxide of lead with eosin red, designed to be inclosed in wood and used as pencils, were held dutiable as pencil leads and not as crayons, under the act of 1890. (G. A. 2457, T. D. 14735, of 1894.)

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for, and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Joseph M. Donohoe, of the Commission's staff, and of others.

MANUFACTURES OF CHIP, GRASS, HORN, PALM LEAF, QUILLS, STRAW, WEEDS, OR WHALEBONE, N. S. P. F.

General Information.

1913 TARIFF PARAGRAPHS.

PAR. 368. Manufactures of bone, chip, grass, horn, india rubber or gutta-percha, palm leaf, quills, straw, weeds, or whalebone, or of which any of them is the component material of chief value, not otherwise specially provided for in this section, shall be subject to the following rates: Manufactures of india rubber or gutta-percha, commonly known as druggists' sundries, 15 per centum ad valorem; manufactures of india rubber or gutta-percha, not specially provided for in this section, 10 per centum ad valorem; palm leaf, 15 per centum ad valorem; bone, chip, horn, quills, and whalebone, 20 per centum ad valorem; grass, straw, and weeds, 25 per centum ad valorem; combs composed wholly of horn or of horn and metal, 25 per centum ad valorem. The terms "grass" and "straw" shall be understood to mean these substances in their natural state and not the separated fibers thereof.

PAR. 369. * * * manufactures of * * * vulcanized india rubber known as "hard rubber," or of which these substances or any of them is the component material of chief value, not specially provided for in this section, 25 per centum ad valorem.

PAR. 643. Whalebone, unmanufactured.

Horn and manufactures of, and combs of horn or metal (treated under paragraph 369).

Manufactures of India rubber, druggists' sundries, and vulcanized rubber known as "hard rubber" (treated separately, see p. 9).

DESCRIPTION AND USES.

This paragraph includes a considerable variety of manufactures of chip, grass, palm leaf, quills, straw, weeds, and whalebone, the qualification n. s. p. f. not restricting narrowly the number of items. Among articles held dutiable are mats made of braids of straw sewn together with cotton; millinery ornaments consisting of natural straw twisted together loosely and looped or tied, used as centerpieces in the crowns of straw hats; palm-leaf baskets; baling twine consisting of two strands of grass braided; bottle covers and caps of palm leaf; and so-called paintings on straw mattings.

Horn and horn strips are used chiefly for making combs, knife handles, buttons, and various novelties, such as napkin rings. Whalebone is a light, flexible, strong substance obtained from the plates with which baleen whales are equipped instead of teeth. The plates vary in length from a few inches to 10 or 12 feet. Chemically it is composed of albumen hardened by phosphate of lime. From it are made

bristles for brushes and stuffing for mattresses; knobs for canes, umbrellas, and parasols; whips and artificial flowers; and formerly umbrella ribs and stiffening for corsets. It has been supplanted by steel in umbrellas, while gutta-percha, celluloid, and similar material are used in dressmaking.

PRODUCTION.

Official production data are lacking in most cases. The domestic whalebone catch is entered chiefly at Alaska and Washington. In 1914 the total reported was 58,000 pounds; in 1916 it was 36,624; and in 1918 it was 9,250, the last amount being entirely from Alaska.

EXPORTS.

Manufactures of straw and palm leaf are the only articles for which exports are shown in official sources. In 1920 these amounted to $1,602,941, and since 1913 have averaged $900,000. They are chiefly to Canada, Cuba, and South America. Whalebone is exported to some extent to England, Canada, and France.

IMPORTS.

Manufactures of quills imported consist largely of quill toothpicks Products of palm leaf, straw, and grass are the largest imports of this class, averaging since 1913 about $400,000, or less than half the average exports of the same item. Canada, China, and Japan are the chief sources. Imports of chip articles were small prior to 1914, but increased to $53,000 in 1919 and over $100,000 in 1917 and 1918. Imports of manufactured whalebone are nil, but the unmanufactured material is imported from Russia and Canada, and lately from the Falkland Islands.

TARIFF HISTORY.

Under the act of 1883 baskets and all other articles of grass, palm leaf, whalebone, * * * or straw were dutiable at 30 per cent ad valorem; the act of 1890 made manufactures of bone, chip, grass, horn * * * palm leaf, straw, weeds, or whalebone, n. s. p. f., dutiable at 30 per cent ad valorem; this was reduced to 25 per cent under the act of 1894 but again increased to 30 per cent by the act of 1897. The act of 1909 added manufactures of quills and increased the duty to 35 per cent. Under the present act manufactures of palm leaf are dutiable at 15 per cent; manufactures of bone, chip horn, quills, whalebone, at 20 per cent; and manufactures of grass, straw, and weeds, at 25 per cent.

MANUFACTURES OF INDIA RUBBER AND HARD RUBBER, N. S. P. F., AND DRUGGISTS' SUNDRIES.

SUMMARY.

In 1914 there were 342 rubber manufacturing establishments in the United States, capitalized at $267,671,422, employing 74,022 wage earners, and turning out rubber products valued at $300,994,000. This was eleven times greater than the value of similar products in 1879; by 1917, however, it had increased nearly 300 per cent.

Articles coming within the tariff classification "not specially provided for" constitute the larger portion of these manufactures. Chief among them are automobile tires. Other products are motorcycle and bicycle tires, rubber hose, rubber boots and shoes, rubber tubing, and druggists' sundries.

Rubber is vulcanized to make it elastic, impervious, and unchangeable in texture under ordinary conditions; qualities which it does not possess in its crude state, but which are necessary for commercial usage. Essentially the process, which was discovered by an American, Charles Goodyear, consists of mixing the cleaned and purified crude rubber with sulphur and subjecting the mixture to moderate heat (about 300° F.). Other chemicals or minerals are sometimes used in addition to sulphur for giving the rubber additional qualities of resiliency, toughness, etc.

The home consumption of manufactures of rubber is enormous, especially of automobile tires. This demand is met by the domestic production, which is sufficient also to permit of large exports. These amounted to more than $85,000,000 in 1920. England is the leading foreign producer, followed by France. England's production is about one-seventh that of this country. Imports are comparatively unimportant, amounting in 1919 to $1,373,469, about 1.60 per cent of our exports for that year.

Ohio, Massachusetts, and New Jersey, in the order named, are the most important producing centers. Ohio produces more than one-third of the total domestic output, its products being tires and general manufactures. Massachusetts leads in the production of rubber boots and shoes, and New Jersey in rubber hose, packing, and belting.

The corporate form of ownership predominates, and the tendency is to concentrate in large establishments with large-scale production. The capital of the 10 largest companies in 1919 was $394,553,000, as compared with $267,671,422, the total capitalization in 1914. In the early part of 1920 production was large, but fell off later in the year, due to decrease of orders and general depression. This depression is still felt (February, 1921), but orders are increasing and production is being resumed. At the present time it is reported that about one-third of the number employed a year ago in the Ohio district are working.

Tennis balls are admitted as manufactures of rubber under this paragraph. Manufacturers of these articles contend that they should be dutiable at a rate equivalent to the duty on wool, as the cover, which is of wool, is the more important part of the ball.

General Information.

DESCRIPTION AND USES.

Manufactures of india rubber, not specially provided for, constitute the largest portion of products of the rubber industry. Various articles of rubber manufacture are covered in the different schedules of the tariff, either specifically or as articles of specified groups (rubber toys; rubber tobacco pouches, dutiable as smokers' articles). The value of these is large, but not so great as the unspecified manufactures, among which are automobile and other tires and tire sundries; rubber boots and shoes; rubber tubing; dentists' rubber supplies; rubber balls, pouches, bulbs, and sponges; partially manufactured rubber; rubber sheets and cakes; rubber hospital sheeting and printing blankets; and many other articles. It is said that one of the larger rubber concerns manufactures 30,000 different articles.

Druggists' rubber sundries comprise such products as hot-water bottles, ice bags, and similar articles; vulcanized rubber, known as hard rubber (par. 369), differs from soft or pliable rubber in having a larger sulphur content and in being vulcanized at higher temperatures. It is used in bowling balls, knife and razor handles, combs, fountain-pen barrels, and other articles of use and adornment.

DOMESTIC PRODUCTION.

Materials and processes.—To render the crude rubber commercially adaptable, it is put through a vulcanizing process to make it elastic, impervious, and unchangeable in texture. This process consists commonly of mixing sulphur with the rubber and subjecting it to moderate heat (about 300° F.) for six or more hours. Sulphur is the most universally used ingredient, being always used to some extent in vulcanization, but other chemicals and minerals are also employed for adding resiliency, weight, toughness, and other qualities, as they

may be required for the finished articles. Among these are zinc oxide, lithophone, magnesia, whiting, and barytes. Cotton, silk, and wool are also used in the making of rubber fabric or cloth.

The crude rubber is first thoroughly cleansed. It is allowed to remain in steam heated water for 24 hours, when it is cut up and the larger impurities removed by hand. It is then washed by passing between two heavy corrugated iron rollers. A stream of water flows over the rubber from a pipe directly at the point of contact with the rollers, and the combined action of the rollers and water removes all foreign substances adhering to the rubber. It is next placed in a drying chamber and, after thoroughly drying, is stored in darkness until needed. Methods of vulcanizing vary with the article being made, but generally the purified and masticated gum is thoroughly kneaded with the requisite amount of sulphur and cut and shaped before heat is applied.

History and development.—The United States has always led the world in the manufacture of rubber goods. The industry had its inception here, the vulcanization process having been discovered by Charles Goodyear, an American. Our output is approximately seven times as large as the next manufacturing nation. In 1906 we consumed 24,113 tons of crude rubber as against 13,868 tons consumed by Great Britain, the next largest consumer; in 1917 our consumption had reached 157,371 tons as compared with 25,983 tons consumed by Great Britain; an increase of about 600 per cent to 100 per cent.[1]

In 1879 the value of domestic products was $25,309,648. This had increased more than elevenfold by 1914. For the decade 1904 to 1914 the increase was 103.4 per cent, while for the latter half of the decade it was 52.5 per cent. Between 1914 and 1917 the increase was nearly 300 per cent.

Organization.—The Census of Manufacturers for 1914 classifies data on rubber products into three groups—rubber belting and hose, rubber boots and shoes, and rubber products not elsewhere specified. The last group is not entirely synonymous with the tariff classification, "manufactures of rubber not specially provided for," although articles coming under such classification form the chief value of the group. Rubber boots and shoes are within the classification. Rubber belting is not, however, nor is hose except that which is made entirely of rubber and not partly of cotton, flax, hemp, ramie, or jute. The greater part of the value of hose shown in the second group probably comprises hydraulic or flume hose, dutiable at 7 cents per pound under paragraph 274. Rubber fabrics and rubber clothes are among the items included in the third group, which do not come within the tariff classification. Elastic woven goods are not included in the data as manufactures of rubber.

In 1914 the industry showed 342 establishments, with 88,821 employees and officials. Of these, 74,022 were wage earners, 13,200 clerks and subordinate salaried employees, and 1,559 proprietors, officials, and salaried officers. Eighteen establishments, with 5,115 wage earners, were engaged in manufacturing belting and hose; 23, with 18,687 wage earners, in manufacturing boots and shoes; and 301, with 50,220 wage earners, devoted to other manufactures of rubber.

dition, products to the value of $752,503 were reported by establishments assigned to other classifi-

EXPORTS.

lome consumption of rubber manufactures is enormous, the fact t 85 to 90 per cent of the world's automobiles are owned here icating the extent of the demand for rubber tires. The domestic put, however, is sufficient to meet this demand and permit of large orts to practically all parts of the world.

All articles are exported to some extent, but tires form the chief m. In 1914 the value of exports was $12,441,220 and in 1920 5,436,897, of which $53,074,015 was tires.

FOREIGN PRODUCTION.

Statistics on foreign production are not available, but the consumption of crude rubber furnishes a basis for comparison. Great Britain's consumption in 1917 was about one-seventh that of the United States; rance about one-tenth; Italy about one-twenty-fifth. Great Britin's exports [5] in 1914 were $11,315,608 and in 1918 $17,139,902.

IMPORTS.

Imports are not serious from a competitive standpoint, amounting to $1,489,680 in 1914, and in 1920 to $1,373,469, or 1.60 per cent of exports. Tires amounted to $194,445, or 0.36 per cent of our exports of tires. Imports in 1917 were less than one-tenth of 1 per cent of domestic production. They are chiefly from Canada and England.

PRICES.

The prices shown on page 32 of this report are taken from the War Industries Board Price Bulletin No. 30. Restrictions on output were placed on rubber manufactures during the latter part of 1918, and, commenting on this, the War Industries Board states:

> These regulations were not in effect sufficiently long enough to have any marked influence upon the price situation in the rubber industry. After the signing of the armistice they were gradually revoked.

[5] Great Britain Annual Return of Trade with Foreign Countries. Pounds sterling converted to dollars at normal exchange, $4.8665.

The total capitalization was $267,671,422; salaries, $16,278,578; and wages, $44,167,402.

The corporate form of ownership prevails, 82 per cent of the establishments being of this type, producing 99 per cent of the total output. The tendency of the business is to concentrate in large establishments with large-scale operation. A few establishments are reported doing small amount of business, but their number is decreasing yearly; 83 per cent of the output in 1914 was by establishments with an annual business of more than $1,000,000. The establishments employing more than 500 wage earners constitute only 11.7 per cent of the total number, but give employment to 70.2 per cent of the wage earners.

Later complete figures are not available. The capital of the 10 largest companies in 1919 aggregated $394,553,000, about 47 per cent greater than the capital of the entire industry in 1914.[2]

Tires are the chief product, in 1914 averaging 48.6 per cent of the total output.

Geographical distribution.—The industry is carried on in a great many States, Ohio, Massachusetts, and New Jersey, in the order named, being far ahead of the others. Ohio's products (tires and general manufactures) exceed the combined totals of New Jersey and Massachusetts. This leadership is due to the development in Akron of the great tire and general rubber manufacturing companies, the production of the city being 84 per cent of Ohio's total. Massachusetts leads in the production of rubber boots and shoes, and New Jersey in the production of rubber hose, packing, and belting. These two States are also large producers of general manufactures.

Production.—The domestic output in 1914 was valued at $300,994,000. In 1917 this had increased to $896,000,000,[3] and for the first six months of 1920 the value was reported to be $577,388,210.[4] Tires and tire sundries, the largest item, were valued at $146,521,569 in 1914 and $394,340,828 for the first half of 1920. The output for the entire year is not known, but it is not thought to be commensurate with the value of products for the first half of the year, due to reduction of orders and curtailment of production in the latter part of the year. This depression still exists (February, 1921), although the outlook is brighter and orders are increasing. In the Akron district the output now is approximately one-fifth of what it was a year ago, and it is reported that less than one-third of the number employed then are now working.

The following table gives the value of the different products in 1914:

[5] Great Britain Annual Return of Trade with Foreign Countries, [illegible]ns, Washington, at normal exchange, $4.8665.

With reference to the price fluctuations it is stated in the bulletin, page 34:

A review of the run of prices for the rubber industry, as a whole—that is, for crude rubber, ingredients, and rubber products combined—makes apparent the fact that with the exception of the 16 months ending January, 1915, the rubber industry price situation had little in common with commodities in general. Low prices characterized the industry by and large. During the six years dealt with in this study there were only 12 months in which the index number of the rubber industry was higher than that of "all commodities," and in all but four these instances variations above the general price level were less than 10 per cent. In February, 1915, rubber prices fell 16 per cent below the level of all commodities, and from that time on the index numbers of the rubber industry and of commodities in general followed individual courses. The latter, after remaining relatively static for some nine months, ascended rapidly, reaching its first apex in July, 1917, at a point of 89 per cent above the level of February, 1915. The governmental policy of price-fixing inaugurated in the summer of 1917 resulted in a slight recession, which continued until June of the following year, when the upward course of prices was resumed. The year 1918 ended with the index number of all commodities 103 per cent above its prewar level.

The index number of the rubber industry, on the other hand, followed a rather slow upward course, which was interrupted now and then by cycles of depression varying from 1 to 10 months in duration. At no time did it approach the index number of "all commodities," and throughout the period following February, 1915, the price level of the rubber industry was at least 16 per cent below the price level of commodities in general. This difference in levels was highest in July, 1917, when the "all-commodities" index number was 80 per cent above that of the rubber industry. Throughout 1917 and 1918, in fact, the divergency existing between the two levels was one of great significance and is to be found in the price fluctuations of but few industries. The signing of the armistice found the price level of the rubber industry 72 per cent below that of all commodities, or, in other words, 31 per cent above its own level of 1913–14.

TARIFF HISTORY.

Under the tariff of 1886 india rubber boots and shoes were dutiable at 25 per cent ad valorem; manufactures of gutta percha at 35 per cent ad valorem, and manufactures of india rubber not specially provided for, at 30 per cent ad valorem. Under the act of 1890 manufactures, not specially provided for, remained at 30 per cent; rubber boots and shoes were not specially enumerated, and vulcanized rubber, known as hard rubber, classed with gutta percha manufactures at 35 per cent ad valorem. The act of 1894 reduced the duty on manufactures of india rubber, not specially provided for, to 25 per cent and that on manufactures of gutta percha and hard rubber to 30 per cent; under the act of 1897 the duties were increased to 30 per cent and 35 per cent, respectively, and the act of 1909 increased the duty on manufactures not specially provided for to 35 per cent, leaving manufactures of gutta percha and hard rubber at 35 per cent. Under this act rubber sponges were made dutiable at 40 per cent ad valorem. The act of 1913 made manufactures of vulcanized or hard rubber dutiable at 25 per cent; manufactures of india rubber or gutta perchas, known as "druggists sundries," dutiable at 15 per cent, and manufactures of india rubber not otherwise provided for at 10 per cent ad valorem.

TARIFF CONSIDERATIONS.

A manufacturer of tennis balls states that tennis balls are admitted under this paragraph as a manufacture of rubber, and contends that this classification of the article, which is composed of india rubber with a wool covering, works a hardship on the domestic manufac-

turer, in that the wool cover is the most important and expensive part of the ball, and that it thus is admitted at a lower duty than the woolen cloth for making such covers.

Manufactures of rubber (total)—Production in United States.

Manufactures of bone, chip, grass, straw, india rubber, etc.—Rates of duty.

Act of—	Par.	Tariff classification or description.	Rates of duty, specific and ad valorem.
1913	368	Manufactures of bone, chip, grass, horn, india rubber or gutta-percha, palm leaf, quills, straw, weeds, or whalebone, or of which any of them is the component material of chief value, not otherwise specially provided for in this section, shall be subject to the following rates; manufactures of india rubber or gutta-percha, commonly known as druggists' sundries:	15 per cent ad valorem.
		Manufactures of india rubber or gutta-percha, not specially provided for in this section.	10 per cent ad valorem.
		Palm leaf	15 per cent ad valorem.
		Bone, chip, horn, quills, and whalebone	20 per cent ad valorem.
		Grass, straw, and weeds	25 per cent ad valorem.
		Combs composed wholly of horn or of horn and metal	Do.
		The terms "grass" and "straw" shall be understood to mean these substances in their natural state, and not the separated fibers thereof.	
1913	369	Manufactures of * * * vulcanized india rubber known as "hard rubber," or of which these substances or any of them is the component material of chief value, not specially provided for in this section.	Do.
1913	643	Whalebone, unmanufactured	Free.
1909	403	Manufactures of bone, chip, grass, horn, quills, india rubber, palm leaf, straw, weeds, or whalebone, or of which these substances or any of them is the component material of chief value, not specially provided for in this section.	35 per cent ad valorem.
		But the terms "grass" and "straw" shall be understood to mean these substances in their natural form and structure, and not the separated fiber thereof.	
		Sponges made of rubber	40 per cent ad valorem.
		Combs, composed wholly of horn, or composed of horn and metal.	50 per cent ad valorem.
1909	404	Manufactures of gutta-percha, * * * vulcanized india rubber known as "hard rubber," or of which these substances or any of them is the component material of chief value, not specially provided for in this section.	35 per cent ad valorem.

1883....	455	India-rubber boots and shoes	Do.
		Gutta-percha, manufactured, and all articles of, not specially enumerated or provided for in this act.	35 per cent ad valorem.

Court and Treasury Decisions.

Mats made of braids of straw sewn together with cotton were held properly classified under this paragraph and not dutiable under paragraph 272 as mats or rugs of straw having a warp of cotton. (Akano *v.* United States, 6 Ct. Cust. Appls., 379, of 1915.)

The provision for manufactures of chip in this paragraph is more specific than the provision for manufactures of wood in paragraph 176 in the case of ropings made of wood, chip, and cotton, chip chief value. (United States *v.* Kronfield, 7 Ct. Cust. Appls., 93, of 1916.)

Dyed straw is not straw in its "natural state" within this paragraph, and leaves and flowers for millinery, made of straw which have been dyed but the fibers of which have not been separated, are excluded therefrom and classable under paragraph 347 as articles in chief value of artificial leaves and flowers. (United States *v.* Gage, 8 Ct. Cust. Appls., 306, 378, of 1918.)

Colored chip-straw millinery ornaments, crudely resembling flowers and leaves, were held likewise dutiable. (United States *v.* Rosenthal-Sloan, 8 Ct. Cust. Appls., 380, of 1918.)

But millinery ornaments consisting of strands of natural straw twisted together loosely and looped or tied, used as centerpieces in the crowns of straw hats, forming the starting points, are within this paragraph rather than paragraph 347. (Abstract 40979, of 1917.)

Palm-leaf baskets (T. D. 36409, of 1916); baling twine consisting of two strands of grass, braided (Abstract 36906; T. D. 34933, of 1914); india rubber bulbs used on pyrographic outfits (Abstract 37299, of 1915); bottle covers and caps of palm leaf (Abstract 36970; T. D. 34969, of 1914); rubber-faced cloth used in making card clothing (Abstract 38775, of 1915); rubber flower syringes (Abstract 37562, of 1915); and so-called paintings on straw mattings (T. D. 35163, of 1915) have been held dutiable under this paragraph.

The language of successive tariff acts show that Congress has regarded india rubber and hard rubber as different things for tariff purposes. Syringes, tubes, combs, and breast pumps, in chief value of hard rubber, are dutiable as "manufactures of * * * vulcanized india rubber, known as 'hard rubber'" and not as "manufactures of india rubber * * * commonly known as druggists' sundries." (Knauth *v.* United States, 8 Ct. Cust. Appls., 102, of 1917.)

Whalebone strips, tied in bundles, assessed with duty under paragraph 343 of the act of 1909, were held free as whalebone unmanufactured under paragraph 710 of the act of 1909. (Abstract 32241; T. D. 33409, of 1913.)

Chip roping in skeins or in the form of bells, consisting of shavings planed from wooden blocks and woven or bound together with cotton cords and then cut parallel to the cords, thus forming chip rope, was held properly classified as a manufacture of chip under paragraph 368 and not as shavings of wood under paragraph 176, nor as an unenumerated article under paragraph 385. (Abstracts 43628 and 43863 of 1920.) "In their natural state" in paragraph 368 of the act of 1913 is broader than "in their natural form and structure" in paragraph 463 of the act of 1909. Paragraph 368 comprehends split straw, so long as the splitting has not resulted in a decortication of the fibers. Split straw and chip material for the manufacture of millinery ornaments, too crude for classification under paragraph 347, come within paragraph 368. (Isler *v.* United States, 10 Ct. Cust. Appls., —; T. D. 38339 of 1920; Abstract 43745 of 1920.)

Horn strips, undrilled, cut into uniform lengths, scraped smooth or polished, or with ends cut square, or with the ends rounded off, are classified under paragraph 368 and not under paragraph 511 of the act of 1913. (T. D. 38351 of 1920.)

Dyed straw is not straw in its natural state within that expression in paragraph 368 of the act of 1913, and articles made of it are not dutiable thereunder. Judicial notice is taken that certain exhibits made of straw are dyed. (Johnson *v.* United States, 10 Ct. Cust. Appls., —; T. D. 38333 of 1920.)

Millinery ornaments in chief value of straw, but not in imitation of fruits, grains, leaves, flowers, and stems, come within paragraph 368 when in chief value of undyed straw and within paragraph 385 as unenumerated manufactures when in chief value of dyed straw. (Cochran *v.* United States, 10 Ct. Cust. Appls., —; T. D. 38336; T. D. 44017, of 1920.)

Artificial leaves and flowers in chief value of straw were held dutiable at 25 per cent and those in chief value of chip at 20 per cent under paragraph 368 of the act of 1913. (Abstract 44021 of 1920.)

IVORY, MOTHER-OF-PEARL, SHELL AND HORN, AND MANUFACTURES OF, ETC.

GENERAL INFORMATION.

1913 TARIFF PARAGRAPHS.

PAR. 369. Ivory tusks in their natural state, or cut vertically across the grain only, with the bark left intact, 20 per cent ad valorem; manufactures of ivory or vegetable ivory, or of which either of these substances is the component material of chief value, not specially provided for in this section, 35 per cent ad valorem; manufactures of mother-of-pearl and shell, plaster of Paris, papier-mâché, and vulcanized india rubber known as "hard rubber," or of which these substances or any of them is the component material of chief value, not specially provided for in this section, 25 per cent ad valorem; shells engraved, cut, ornamented, or otherwise manufactured, 25 per cent ad valorem.

PAR. 368. Manufactures of bone, * * * horn * * * not specially provided for in this section * * * 20 per cent ad valorem; * * * combs composed wholly of horn or of horn and metal, 25 per cent ad valorem.

PAR. 511. Horns and parts of, including horn strips and tips, unmanufactured. Free.

PAR. 570. Pearl, mother of, and shells, not sawed, cut, flaked, polished, or otherwise manufactured, or advanced in value from the natural state. Free.

PAR. 628. Teeth, natural, or unmanufactured. Free.

Manufactures of india rubber known as "hard rubber." (See par. 368.)

Manufactures of plaster of Paris. (See par. 74.)

DESCRIPTION AND USES.

Mother-of-pearl is the hard, pearly, internal layer of several kinds of shells, especially of pearl oysters, river mussels, and abalone shells. The shells are found in the greatest perfection on the coasts of Ceylon, in the Persian Gulf, and in the Australian seas. Fresh-water shells of the mollusk have been found in the Mississippi River and tributary streams and to a small extent in other American rivers. It is used largely in the arts, particularly for inlaid work in toys, knife, opera glass, and other handles, and very largely for buttons. Other shell employed for various purposes include snail, starfish, and tortoise shell. The last is used extensively for combs, hairpins, and similar hair ornaments; in inlay work; for ornamental boxes and other ornamental purposes.

Horn and horn strips and tips are used chiefly for making combs and hair ornaments, knife handles, and various novelties such as napkin rings. Natural teeth of animals are not in demand commercially except for ornamental purposes. The teeth of some animals were formerly used in dentistry, but artificial teeth are now entirely used.

Ivory tusks are mainly those of the African elephant, these constituting the best part of commercial ivory. Other sources are the tusks of fossil elephants found in Russia, Siberia, and Alaska; and the teeth of the narwhal, walrus, and hippopotamus. These latter are inferior to elephant tusks, which are considered true ivory. Manufactures of ivory include numerous articles useful and ornamental, such as toilet articles, statuettes, and piano keys, the demand for the last being so great that imitation products must be drawn upon to meet requirements. Vegetable ivory manufactures consist of handles of umbrellas, toilet articles, small trinkets, etc. Buttons, the chief manufacture of this material as well as of mother-of-pearl and shell, are specially provided for and therefore do not come within the provisions of this paragraph.

Papier-mâché is a tough, plastic substance made from paper pulp mixed with glue, paste, oil, resin, or other sizing. It is used in boxes, trays, and similar articles, and is also employed in interior decorations of houses, for cornices, ceilings, etc.

DOMESTIC PRODUCTION.

Production data are not completely available. The domestic output of horn and horn strips comes from the packing plants. Those sold to the button makers are assorted into three grades, known commercially as Nos. 1, 2, and 3, ranging from $260 to $125 per ton. Practically all domestic mother-of-pearl and shell is derived from the mussels of the Mississippi River and its tributaries. A survey by the Bureau of Fisheries indicates that the production varies from 40,000 to 60,000 tons per year, with a value of between $800,000 and $1,000,000. About 1,000 persons are engaged in the domestic pearl fishery.

Unspecified manufactures of ivory, mother-of-pearl, shell, horn, and bone are grouped by the Census of Manufactures under the classification "Ivory, shell, and bone work," with total production for 1914 of $1,896,000. This, however, does not completely cover production of this industry, as such articles as combs, hairpins, and piano keys are not included. Separate data are given for combs and hairpins not made from metal or rubber, which, however, include products made from fiber and celluloid. The total production in 1914 was $5,478,000. With reference to this classification, it was stated in the 1913 tariff hearings by a manufacturer that horn combs composed only about $500,000 of a total of $8,275,932 in 1910. The horn combs generally sell at low prices, the majority at 5 and 10 cents, and thus probably constitute the smallest portion of the value under the classification. The combs, hairpins, and various other ornaments which are made of bone, ivory, and tortoise shell are more expensive than the horn combs, and it may be assumed that their value forms a very large portion of the total shown. In addition

to the value shown for these two groups, ivory, shell, and bonework to the value of $250,608 was reported by establishments assigned to other classifications.

ORGANIZATION.

In 1914 there were 54 establishments classified as manufacturers of ivory, shell, and bone work, and 66 establishments as manufacturers of combs and hairpins, not made from metal or rubber. The former group employed 795 wage earners with wages of $391,000 and capitalization of $1,160,000; the latter, 2,773 wage earners, with total wage of $1,393,000 and capitalization of $2,959,000. New York and Massachusetts are the leading States under each classification.

EXPORTS.

Exports of shells in 1919 amounted to $574,575, chiefly to United Kingdom, Canada, and France. Germany, a large buyer of American shells prior to the war, in 1919 imported $22,752 worth. Exports of ivory are not shown subsequent to 1917. In that year they amounted, including manufactures and scrap, to $175,458, most of which was sent to Canada. Bone manufacturers are not separately shown after 1917. The exports in that year were $103,477, the highest.

IMPORTS.

Mother-of-pearl and shell are imported chiefly from Australia, French Oceania, and the Straits Settlements. Shipments of considerable value are also made from the Philippines. In 1920 the value of mother-of-pearl importations was $2,460,677; of shells not sawed, cut, or otherwise manufactured, $272,663. The value of shells advanced in value is not large, averaging between 1908 and 1918 about $39,000. The value in 1919 was lowest ($4,504). Manufactures of shell and mother-of-pearl are principally from England, France, and Japan. In 1920 their value was $47,560.

Tusks are imported chiefly from England, Belgian Congo, and Egypt. In 1920 imports for consumption amounted to $2,184,164. Manufactures of ivory are chiefly from England, France, and Japan, as are also manufactures of bone and horn, including combs. The manufactures of ivory are chiefly of true ivory, very little of the imports being manufactures of vegetable ivory. Formerly Scotland was a very large exporter of horn and bone products to the United States, but in recent years the amount has decreased and the majority of exports from the United Kingdom are from England. The imports of ivory manufactures in 1920 was $140,314; of bone and horn products, $198,595, of which $73,262 was combs.

TARIFF HISTORY.

Under the tariff act of 1883 manufactures of bone, horn, ivory, or vegetable ivory, not specially enumerated or provided for, were dutiable at 30 per cent ad valorem; shells, whole or parts of, manufactured of every description, n. s. p. f., at 25 per cent ad valorem. The act of 1890 increased both these duties to 40 per cent ad valorem. This act included mother-of-pearl in this group, but eliminated manu-

actures of bone and horn. The duty was reduced to 35 per cent by the act of 1894 and remained the same under the acts of 1897 and 1909. At present manufactures of ivory and vegetable ivory are dutiable at 35 per cent; manufactures of mother-of-pearl, shell, and papier-mâché, at 25 per cent; and shells, engraved, cut, ornamented, or otherwise manufactured, at 25 per cent.

Papier-mâché was dutiable at 35 per cent under the act of 1890; at 30 per cent under that of 1894; 35 per cent under that of 1897 and 1909.

The duty on manufactures of bone and horn remained at 30 per cent under the act of 1890; was reduced to 25 per cent in 1894; again placed at 30 per cent in 1897, and increased to 35 per cent under the act of 1909. It is now dutiable at 20 per cent.

Combs were not specifically mentioned in the acts between that of 1883 and 1909. All combs were dutiable by the act of 1883 at 30 per cent. In 1909 the duty on combs composed of horn or horn and metal was placed at 50 per cent. It is now 25 per cent.

Unmanufactured mother-of-pearl, shell, ivory, and vegetable ivory, horns and parts of, and unmanufactured teeth, have been free.

COMPETITIVE CONDITIONS.

Imports are mostly of raw materials which do not enter into competition with domestic products. Shells and mother-of-pearl imported are salt-water shells chiefly, differing in quality from the domestic fresh-water shells. The only manufactures which appear to offer serious competition are those of horn and bone, especially horn combs.

In a brief filed by American manufacturers in 1913 it is stated that labor costs in Europe were less than one-third of American wages, this applying particularly to Scotland, whose competition was most seriously felt, that the work was done chiefly by women and children, and that American machinery was in use, which tended to still further reduce the labor cost.[1] Our census reports for 1914 show that this work is done here mostly by men, 74.4 per cent of the wage earners being male. The foreign manufacturers also have an advantage in the raw material, the practice in this country of dehorning cattle making it necessary for domestic manufacturers to import horns to a large extent. The reduction of duty in 1913 was followed by a temporary increase in the amount of imports, the total for 1914 being the highest reached. The increase did not continue, the values for the following years being less than those for the years prior to 1914. This decrease may have been due to war conditions, but there was no increase with the close of the war, the totals for 1918 and 1919 being very much lower than the average. For 1920 the imports are the highest since 1914, although not as high as before 1914. Scotland formerly was the most serious competitor, but imports from there are now very small, while those from England also have decreased slightly. Japan, however, is exporting some quantities to us.

[1] Brief [illegible] 1913, Vol. V, p. 4004.

TARIFF CONSIDERATIONS.

Vegetable ivory in its natural state is not specifically provided for in the present tariff. It is admitted free under paragraph 552 as "vegetable substances, crude or unmanufactured, not otherwise specially provided for." The imports of this material are large enough to be specifically provided for in the free list.

Gallilith might be added to the articles enumerated in paragraph 369. It is a plastic substance, similar in appearance to pyroxylin, but different in composition. It is used for much the same purposes as ivory or mother-of-pearl, such as buttons, beads, umbrella and cane handles, cigar and cigarette holders, necklaces, watch fobs, sautoirs, etc.

DOMESTIC PRODUCTION.

Combs and hairpins, not made from metal or rubber.

[Census of Manufactures, 1914.]

Year.	Number of establishments.	Wage earners.	Capital.	Wages.	Value of products.
1914	66	2,773	$2,959,000	$1,393,000	$5,478,000
1909	81	4,555	5,070,000	2,166,000	8,376,000
1904	42	1,806	1,112,000	758,000	2,769,000
1899	34	1,399	833,000	572,000	1,976,000

Ivory, shell, and bonework, not including combs and hairpins.

[From Census of Manufactures, 1914.]

Year.	Number of establishments.	Wage earners.	Capital.	Wages.	Value of products.
1914	54	795	$1,160,000	$391,000	$1,896,000
1909	52	907	1,159,000	466,000	1,865,000
1904	66	1,769	1,269,000	777,000	2,864,000
1899	70	1,334	940,000	529,000	1,873,000

The products of establishments under the classification ivory, shell, and bonework include a wide variety of articles for use or ornament. In addition to the products covered by the two tables, ivory, shell, and bone work to the value of $250,608 was reported by establishments assigned to other classifications. The table for combs and hairpins includes products made from fiber and celluloid in addition to those made from bone, ivory, shell, and horn. The figures for 1909 include data for a number of establishments which were included under ivory, shell, and bonework in 1904, the decrease between 1904 and 1909 in the second table is, therefore, only apparent. With this exception the figures in the second table may be properly considered comparable for the different years, but for the first table they are not, owing to various changes of classification.

Court and Treasury Decisions.

A *box* in chief value of wood, designed to contain an ivory toilet set, which was packed separately, was held dutiable with the toilet set as an entirety under the provision in paragraph 369 for manufactures of ivory. (Abstract 36870, T. D. 34920, of 1914.)

Heads of game animals, as cut from the carcass, are exempt from duty under paragraph 423, 511, or 604. (T. D. 34061, of 1914.) *Moose heads with skin attached* are held not to be classable as an entirety, but the horns and parts of separately from the skin. (Abstract 23064, T. D. 30547, of 1910.) *Elk* and *moose horns* attached to the skull, from which the flesh and skin have been removed, are within paragraph 511. (G. A. 5652, T. D. 25231, of 1904.) *Sliced deerhorn*, used as a medicine by the Chinese, is not within paragraph 511 but is dutiable as a medicinal preparation. (T. D. 36401, of 1916.) By reason of the change of its location in paragraph 589 of the act of 1909 and in paragraph 511 the word "unmanufactured" was held to qualify all the enumerations and not merely "horns and parts of," as in prior tariff acts. Under this construction *horn strips, polished*, with the ends rounded and drilled, are dutiable as manufactures of horn under paragraph 368. (T. D. 34535, of 1914.)

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Paul M. Tyler and Henry J. Bierman of the Metals Division of the Commission's staff, and of others.

ASBESTOS, UNMANUFACTURED.

SUMMARY.

The amount of asbestos consumed by the United States annually exceeds the combined consumption of all other countries of the world, and of the total world output it produces only about 1 per cent, about 99 per cent of the total consumption being imported.

Known deposits of asbestos in the United States are entirely inadequate to supply domestic needs and, although efforts are being made by the Government to discover additional areas, it is probable that no very large deposits of the mineral exist in this country.

At present our chief source of supply is Canada, which supplies fully 95 per cent of the total annual imports. The bulk of the imports from Canada consist of "mill" fiber, and the rest "crude" fiber. Imports from other countries consist wholly of crude fiber, and come in largest quantity from southern Africa—Rhodesia and the Union of South Africa.

Canada produces about 85 per cent of the total world output and exports about 90 per cent of its total annual production to this country.

Canada has the world's largest known asbestos deposits and the quality of the mineral is unexcelled for most uses. The principal mines are conveniently located to the United States—just across the border in the Province of Quebec—and will probably continue to be the chief source of this country's future supplies.

Asbestos, unmanufactured—Summary table.

General Information.

TARIFF ACT OF 1913.

PAR. 406. Asbestos, unmanufactured. (Free.)

DESCRIPTION.

The term asbestos, as commonly used, includes half a dozen minerals all having a well-developed fibrous structure but differing in chemical composition and in some physical characteristics. The most important of these minerals commercially is *chrysotile*, or serpentine asbestos. About 95 per cent of the asbestos used in manufacturing is chrysotile and it commands a better price than the other fibrous minerals on the market. *Amphibole* asbestos is generally found in shorter fibers and its special use is in chemical laboratories and works where resistance to the action of acid is demanded. *Crocidolite*, or blue asbestos, is a special variety of amphibole asbestos differing from the others in appearance and in that it is more fusible, whereas an important property of other forms of asbestos is that they all resist even very high temperatures.

Uses.—The fundamental property of any asbestos mineral that distinguishes it from all other minerals is that it is separable into fibers similar in many respects to cotton, wool, and other articles of vegetable or animal origin. The use depends on the length and fineness of the fiber, on its resistance to the action of heat and chemicals, and on its insulating value as a nonconductor of heat and of electricity. The most important applications of asbestos are for brake linings, boiler and steam pipe coverings, building paper, electrical insulation, and in plaster and paints, and for most of these purposes chrysotile is superior to other varieties. A special use, for amphibole asbestos only, is in chemical laboratories and works.

Market grades.—"Unmanufactured" asbestos as it comes on the market has been separated from adhering rock and consists of fibers graded according to length. The longer fibers that can be picked out by hand are sold as "crude." *Crude asbestos* is divided into (1) a high class material with fibers over three-quarters of an inch long, used for the best grades of materials, and (2) fibers shorter than three-quarters inch but suitable for spinning and weaving. The remaining rock is sent to the mill and mechanically crushed and separated into three grades of "mill stock," according to the length of fiber. Mill stock is rarely suitable for weaving but can be made into pipe coverings, insulating materials, shingles, lumber, paper, and other articles.

In addition to these is "asbestic," which consists merely of roughly ground serpentine residues, about like very coarse sand or of very finely ground asbestos, commonly called "floats." It is suitable for the manufacture of plaster cement, fireproof brick, and similar articles.

Domestic Production.

The marketed production of asbestos in the United States in 1919 was 1,361 short tons, valued at $251,265, an increase of 359 tons over the production in 1918, but an amount somewhat smaller than the annual production during the three years preceding 1918.

Equipment and organization.—No large capital is required for the mining and treatment of asbestos as it is produced in the United

States, and it is doubtful if many deposits would justify large investments. This condition is different from that of Canada and certain other foreign producing countries where large deposits have led to the investment of moderate amounts of capital in machinery for mining and handling the rock, and more or less extensive treatment plants for preparing the fiber.

Geographical distribution.—Asbestos is mined in the United States chiefly in five States—Arizona, California, Georgia, Maryland, and Oregon. Georgia has for many years been the largest producer of asbestos in the United States, although the more important product has come from Arizona. The latter is high grade, containing a large proportion of spinning fiber, and the second-class fiber, because of its freedom from iron, is superior for electrical and some other purposes to most of the asbestos found in other countries. The Georgia fiber is valuable only for paints, cements, coverings, and similar articles, and can not be used in spinning.

Arizona.—Production of asbestos in Arizona began in 1915 and it was not until 1916 that the output became considerable. There were five producers by the end of 1918. The principal production was at Ash Creek, near Salt River, about 40 miles northeast of Globe, but mining has progressed northward beyond Salt River in the Sierra Ancha. The first discovery of asbestos in Arizona was in the Grand Canyon, but the depth was so great as to make exploitation and transportation to the railroad a matter of considerable difficulty. Thus far no industry has developed in that region.

Two grades are produced. One is a fine, soft, silky fiber of first-class textile quality; the other is harsh fiber, unsuited to making textiles. It yields a great deal of "splint" that makes a rough-looking yarn very unsatisfactory for most textile purposes. Both grades are found in the same mine, the lower grade being invariably more abundant. The unusually small percentage of iron in the Arizona asbestos makes it superior to Canadian fiber for electrical insulation.

The limits of the Arizona asbestos field have not been defined. The output will never be large compared to that of Canada, but under proper management should be approximately 1,000 tons a year of valuable fiber for years to come.[1]

California.—The Klamath Mountains, the Coast Range, and the Sierra Nevadas are rich in serpentine and in places the rock contains considerable asbestos. In 1918 the principal production was in Nevada County. No production of crude fiber was reported, but several grades of mill fiber were produced and used in making flooring, stucco work, straw-pipe covering, and asbestos cement.

In 1918 there was a small output of asbestos in Calaveras and Alameda Counties, and operations which showed fine crude fiber were reported in Fresno County. Prospects were also opened in several other counties, but the fiber is too short for spinning, and, although some crude occurs which is 1¼ inches long, profitable development is for the most part not expected.

Georgia.—For several years a mine near Sall Mountain has been the largest producer of asbestos in the United States. The mill is located at Gainesville. The asbestos is of the massive type of anthophyllite. Fibrous bundles constitute the whole mass of the rock. Only the surface portion, where the rock has been softened by

[1] J. S. Diller. Mineral Resources, U. S. Geol. Survey, 1916, Part II, p. 20.

weathering, is milled. The solid portion of the rock is too hard for milling. In the absence of some way being found to treat this unweathered material successfully the supply will be greatly restricted. However, in Georgia there seems to be a fairly good supply available of weather-softened rock for the near future. The product is used largely in the manufacture of paints, fireproof cements, and other articles in which short fibers can be used.

Wyoming.—The asbestos deposits of Natrona and Fremont Counties have attracted much attention, but have thus far yielded only a small quantity of commercial asbestos. In the report of the United States Geological Survey for 1917 attention is called to the deposit owned by the American Fireproofing & Mining Co. about 28 miles south of Lander. A small quantity of spinning fiber obtained there was manufactured into yarn and wicking. The mine was practically closed in 1918, and the small supply of asbestos on hand is reported to have been kept in storage unsold.

Oregon.—One asbestos mine in Oregon operated for a short time in 1918. The output was reported small and of three grades of material. The lowest grade, which embraced the largest quantity, was asbestic.

Other States in which deposits of asbestos occur are Vermont, Idaho, and Virginia. The mineral is not mined in Vermont and only rarely and in small quantities in the two other States.

Methods of production—Mining.—The large mines of Quebec are worked almost exclusively open-cast. The operation is quite similar to any quarry operation on a large scale. The ore is broken in benches—drilling either by hand or by machine—and loaded into boxes, which are hoisted out of the pit by cable or boom derricks. Occasionally the quarry floor is connected with the hoisting plant by an inclined shaft or tunnel, and the rock is run out in cars or skips. This is a recent innovation, sometimes coupled with the introduction of steam shovels for loading the cars. Rarely underground mining is resorted to, especially for the purpose of avoiding delays in bad weather. The methods do not differ from those applicable to deposits of other rock or ore.

Milling—Cobbing.—A certain amount of hand sorting is done in the quarry, and barren material is, so far as possible, left unbroken or, if necessary to break, may sometimes be left on the quarry floor and not hoisted. It is always kept separate from the productive material. When rock is sufficiently high grade, it is sent to a cobbing house, where it is broken and screened for the removal of crude fiber. This is done by hand. Both men and women are generally employed in the Canadian mills for this work.

Drying.—The rejected rock from the cobbing house, together with all the milling rock from the quarry, is sent to the mill, where it receives a preliminary rough breaking. Since the material carries a large amount of moisture as it comes from the quarry, it must first be dried. This is generally done in rotary driers of typical design, in which the hot gases from a fire box pass over the drying rock in a slowly revolving steel cylinder. These cylinders are sometimes fitted with perforated ends and act as trommels, separating the coarse rock that requires further reduction.

Crushing.—The dried ore is broken in coarse crushers of the jaw or gyratory type to about 1½ inches maximum diameter. It then passes to rolls, which reduce it in one or more stages to a size suitable for the fiberizer—usually about one-half inch.

Fiberizing.—All the breaking and crushing to this point in the manufacture has been merely for the purpose of liberating the fiber from the rock. In order to make the rock more amenable to the final extraction of the fiber, it is necessary that the coarse fiber or stone asbestos, which for the most part leaves the above machines in the form of small lumps, be divided and split into fine, cottony fiber. This operation is done in a "fiberizer"—either a cylindrical beater or a "cyclone." The former consists of a cylindrical shell in which chilled iron beaters revolve. These strike the rock particles against the outer shell. The repeated blows either reduce the rock to fine grains or fiberize it. The material is gradually driven from one end of the beater to the other, because the faces of the beaters are set at a slight angle. The beater blades run about 300 revolutions per minute.

The Cyclone machine is now used in almost every asbestos mill and is the most important step in the whole separation. It consists essentially of two beaters of the screw-propeller type, driven at a high speed (2,000 to 2,500 revolutions per minute), usually in opposite directions, and inclosed in a cast-iron chamber. The rock is fed just above the beaters. The whirlwind created by the beater hurls the particles against each other and the sides of the chamber with such rapidity and force that the reduction of the material to grains or even impalpable powder takes place almost instantly. All material smaller than peanut size is thrown out of the chamber and generally falls first on a shaking screen placed in an air-tight box connected with a suction fan, which assists in the discharge of the cyclone and removes part of the fiber. The beaters wear out rapidly and must be replaced every 10 to 14 days. The capacity per 10-hour shift varies from 20 to 30 tons of hard, tough rock to 50 to 60 tons of softer material. As a rule, the size of rock charged is not larger than a walnut. Coarser material cuts down the capacity as well as increases the wear on the blades. The maximum size of sand discharged runs from one-sixteenth to one-eighth inch.

Occasionally the fiberizing is done in two or more stages; usually a cylindrical beater as the first machine is followed by one or more "cyclones." Between each pair of machines fiber is drawn out by a suction fan; fine sand (usually one-sixteenth inch and less) is screened out and the material oversize elevated to the next machine for re-treatment. The sand or undersized screening is tailing that either goes to waste or is ground finer and sold as "asbestic" for plaster, etc. The action of the suction fans is similar to the winnowing of chaff from grain, except that the light material in this instance is saved.

Grading of fiber.—The final stage in the milling process is the treatment of the fiber extracted from the rock. All of this goes to collectors. From them it passes through a revolving screen having arms inside that revolve in opposite directions in order to separate the different lengths of fiber. Two grades are made, which are treated separately in two shaking screens, which effects partial separation of the sand adhering to the fiber. The fiber on these screens is sucked into collectors. The longer fiber is screened again in a trommel. The oversize constitutes fiber No. 1. The undersize, after being again treated on a shaking screen to remove the sand, is drawn back again into the same collector.

The material from the first screening goes through the same process as the second and a third and fourth if more grades.

History.—Asbestos was used commercially in ancient times. Its discovery is attributed to the Romans who obtained their supplies from the Italian Alps and Crete. The Alpine variety was known as "amianthus," from a Greek word meaning "unpolluted." Asbestos mattress at Carcassonne, in the south of France on the eastern coast of Greece, and in Cyprus was used in weeks for the perpetual burning lamps of the temples and wicks and napkins that could be cleansed by fire. Amianthus cloth was also used in cremations, mourners that were wrapped after bodies placed in the funeral pyre to retain the ashes of the dead.

Through the Middle Ages asbestos was rarely mentioned and was probably practically forgotten in Europe. Marco Polo states that while traveling through Siberia in the thirteenth century he was shown cloth made from amianthus which was cleansed by the action of fire.

Asbestos was rediscovered in the Urals in 1720, and a factory for its manufacture was built 40 years later. Interest in the mineral was again revived in Europe in 1860 when a London syndicate made the first modern attempts to exploit asbestos deposits. Mining operations began in Quebec in 1878 and the arrival of shipments of the latter grade mineral in London created a sensation. From then on development was very rapid until 1900, when it suffered a serious setback by overproduction and fall in price. The latter resulted in the adoption of mechanical means for separating the fiber. Before 1914 very little asbestos was produced in Rhodesia and commercial production did not begin in the South African field until about 1916.

In the United States asbestos has been mined for nearly one-half century, but it was not until about 1908 that deposits of this mineral yielding fiber of good spinning quality was discovered in Arizona. Production from the Arizona deposits has only been on a small scale and has met the requirements for a small part of the total spinning fiber consumed in this country. These deposits are now (1920) being investigated by the Geological Survey in order to ascertain the possibility of their supplying the needs of the country.

Domestic production and consumption.—In the calendar year 1919 the production of asbestos in the United States was 1,561 short tons, valued at $151,241. By adding to the quantity produced the amounts for unreported sales and deducting the quantity exported (1,222 tons), an approximate consumption of 1,350 tons is arrived at for the year 1919. It is evident, therefore, that the domestic production in this country is only a very small part of the amount annually consumed.

That the domestic output of asbestos is less than the total annual consumption is due largely to the general low average grade of the domestic mineral, the bulk of which is suitable only for making pipe coverings and cement or for paint, and because supplies of spinning fiber can be obtained from the Canadian mines at prices equally as low as those asked for the American mineral.

Imports and exports.—Specific imports of domestic asbestos are made nearly every year in small amounts.

In the calendar year 1919 the total exports amounted to 999 short tons, nearly one-half of which was sent to Italy. Slightly more

than one-fifth to England, and much smaller proportions to Canada, Germany, France, and a few other countries.

The amount exported has never been very important. It is probable that a large part is made up of amphibole fiber for chemical uses, since the United States is the chief producer of this asbestos mineral, and some short fiber for use in the manufacture of pulp products.

FOREIGN PRODUCTION.

Canada produces over 85 per cent of the world's total supply of asbestos. In normal times Russia is the second largest in order of production. During the last few years South Africa, including Rhodesia and the Union of South Africa, has produced increasing amounts annually, exceeding, it is believed, the output of Russia since 1916.

Canada.—The principal asbestos deposits of Canada are located in the Province of Quebec and occur in a long series of basic intrusive rocks, usually referred to as the "serpentine belt." This belt starts in the United States and enters Canada at the boundary line between Vermont and the Province of Quebec. From the international boundary line the general trend of the serpentine belt can be traced in an almost continuous development of rocks, presenting a narrow zone over 170 miles long. Then comes a gap of about 130 miles followed by another development of serpentine rocks. The asbestos-bearing rock of the serpentine belt may be roughly divided into five separate fields or areas, each one of which possesses distinctive features. Chief among these is the Thetford-Black Lake field, by far the most important asbestos producing area in the world. Practically the whole of the Canadian long fiber, hand cobbed asbestos (designated as "crude" asbestos), as well as about 70 per cent of the "mill stock," comes from these deposits. The belt of serpentine rocks is here traceable over a distance of 12 miles, while its greatest width is about 3 miles. The Quebec Central Railway crosses the deposits, and most of the mines are located within a few hundred feet on either side of the track. This railway connects both the Broughton field (which produces mostly short fiber) and the Thetford-Black Lake field, with the city of Quebec at its northern terminus, where ocean transportation can be had for nearly eight months of the year, and with Sherbrooke at the southern terminus, where it connects with the system of American railways, by the Boston & Maine Railroad, the Maine Central Railway, and the Grand Trunk.

The formation of the Quebec asbestos deposits are such as to indicate beyond reasonable doubt that the deposits continue in depth, without changes in their nature, perhaps beyond the level of economic mining. At all events the work of exploitation and development carried out in the mines at Thetford and Black Lake appears to bear this out, and there does not seem to be any cause to fear that through exhaustion of the serpentine, the deposits will give out in the near future.

At present the largest excavation in the asbestos field has reached the following dimensions: Length, 900 feet; width, 600 feet; and depth, 275 feet. At that depth there has been no change whatever in the nature of the ore, the percentage of asbestos, or in the quality, quantity, and length of the fiber. Moreover, in some of the pits

much greater depths have been reached in diamond-drill holes, and it may be stated that the asbestos-bearing serpentine extends to depths of over 500 feet below the surface.

Asbestos was discovered in Canada as early as 1847, but mining operations did not begin until 1878, in which year 50 short tons were produced in the Thetford field. The opening of other mines soon followed, with resulting rapidly increasing annual output until in 1914 the total production amounted to over [illegible] short tons.

Russia.—The principal Russian asbestos mines are situated in the serpentine areas of the Urals. There are also deposits of considerable extent in Siberia. Asbestos is known to occur in the Caucasus, but the mines are small and the fiber is of poor quality. The mineral is produced chiefly in the Urals. The asbestos is harsher than Canadian asbestos and for this reason, in spinning the fiber is commonly used in connection with Canadian fiber, though it is possible to spin it alone. Authentic statistics of Russian production have not been available since the revolution early in 1917.

Southern Africa.—One of the factors in the development of South African production is the improvement in transportation facilities. Prior to 1914 very little asbestos was produced in Rhodesia, but in that year a railroad was built to Victoria after which the annual production increased greatly. In fact the output in 1915 was over four times as large and in 1916 over twelve times as large as in 1914. The progress in southern Africa is still hampered, however, by slow and expensive transportation of asbestos from mining districts and also by the lack of capital, since asbestos is but little known or understood by African capitalists, who are more interested in the gold, diamond, coal and copper fields. However, responsible parties representing various producers in England, America, Japan, and Australia are reported interested in the South African fields. The [illegible] to assist small producers by frequently [illegible] conditions, requirements and market prices and [illegible] a system of cooperation whereby it is hoped to secure [illegible] grading, and selling prices. Local [illegible] are actively promoting the development [illegible] One notable instance was the formation of the [illegible] which is expected ultimately to [illegible] relation to the entire crocidolite [illegible] and amphibole asbestos occur [illegible] southern Rhodesia. [illegible]

The output of asbestos in Rhodesia shows remarkable advances in production in 1920, the total output for the first six months being 7,168 tons, or nearly as large as the entire 1918 production. Practically the entire output is of spinning grades.

The Union of South Africa contains asbestos deposits of large size, and the mineral mined consists chiefly of crocidolite (blue asbestos) and amosite (which in many respects closely resembles crocidolite), but chrysotile is also worked.

Amosite is the name given in 1918 to a monoclinic ferrous amphibole by the "Asbestos Mines of South Africa," the company chiefly interested in its production. The fiber-bearing rocks occur in the Transvaal and cover an area 60 miles in length and 6 miles in width. Commercial production began about 1916. Amosite is the principal variety mined in the Transvaal, though chrysotile, crocidolite, and tremolite are also mined to a smaller extent.

In the Cape Colony field crocidolite is the only variety of asbestos worked. The fiber is usually lavender blue, but color variations are not uncommon, being in some cases pale yellow or rusty brown. Such discolored fibers are harsh to the touch, and command only a limited sale. Fully three-fourths of the total production of the Union of South Africa from 1915 to 1919 came from the Cape Province.

IMPORTS.

In the calendar year 1920 the imports of unmanufactured asbestos was 167,558 short tons, valued at $9,120,253, having increased to this amount from 59,235 tons in 1910 by almost unbroken annual increases.

Fully 95 per cent of all the asbestos imported into the United States comes from Canada and represents over 90 per cent of the total production of that country. Imports from other countries have been mostly sporadic, and it was not until 1917 that the mineral began to come from southern Africa with any indication of stability in the movement. The regular annual importations of South African asbestos since that year are due largely to the Cape Asbestos Co., credited with producing 80 per cent of the entire output of African blue asbestos (crocidolite). This company prepared its product in a way which eliminated difficulties formerly encountered by American manufacturers in spinning the fiber.

Imported Canadian asbestos includes a large percentage of "mill stock," whereas imports of South African material consists wholly of "crudes."

PRICES.

The various grades of asbestos have never been standardized, and this is a source of great inconvenience to the buyers, as purchases have to be made on samples submitted. Each producer has his own method of grading, and his own special mark or designation for rock grade. There is, however, a uniform method of testing the length of fiber of the "mill stock" qualities, and some of the large users of asbestos have their own representatives at the mines to examine and test each shipment as it is made.

63189—21—N-20——3

The grading is based on (1) the life of the fiber, which depends on the strength and resiliency of the threads; (2) the length of the fiber; and (3) on the color of the fiberized material.

For the purposes of statistics, the Quebec Bureau of Mines has adopted a classification based on the selling price of asbestos which divides it into two grades of "crude" or hand-cobbed material, and three grades of "mill stock," or fiber recovered by mechanical means after crushing and pulverizing the rock.

In 1915 Canadian fiber of a well-known grade was bought at $50 to $60 a ton; in 1916, at $100; in 1917, at $200; in 1918, at $250; in 1919, at $300. In 1920 the price asked was from $400 to $525.

The best grade of Canadian spinning fiber in 1917 ranged from $700 to $1,500 a ton; in 1918, at from $1,200 to $2,000 a ton. At the close of 1920 the best grade was selling as high as $3,500 a ton.

TARIFF HISTORY.

Asbestos was specifically mentioned for the first time in the tariff act of 1864, which imposed a duty of 25 per centum ad valorem. The duty was removed by the act of 1870, and since that year unmanufactured asbestos has been on the free list. Unmanufactured asbestos was adjudged to include fiber separated from the containing rock.

COMPETITIVE CONDITIONS.

The United States is the largest consumer of asbestos in the world and manufactures more asbestos products than any other country; but it has never been, and shows no promise of ever becoming, an important factor in the production of the unmanufactured product. Its meager output could be increased to some extent but it will probably never become great enough to supply the domestic demand. The United States must, therefore, rely largely upon imported crude material.

The chief source of asbestos is in Canada, just outside the borders of this country. The supply from Quebec is large, cheaply mined, excellent in quality, and so readily available that there is little stimulus to domestic production of medium grades of average quality from the less favored American deposits. As the only producer of both long and short fibers, Canada holds the leading position in the world markets.

Formerly American production consisted almost exclusively of the cheapest material, suitable only for paint making or other purposes requiring only very short fiber. There was also some production of extremely poor rock for local requirements and too low in value to bear transportation charges. This demand has fallen off but has not wholly disappeared. The brightest outlook for domestic production is in the Arizona output of exceptionally good spinning fiber and of special quality, superior for electrical purposes. A less important demand is met by the production of asbestos fiber, for use in filters and chemical work, from amphibole deposits found in the crystalline rocks of Maryland.

The continuance of the Arizona industry is assured. Although the cost of production will always be much greater than in Canada because of the nature of the deposits, the proportion of valuable spin-

ning fiber is greater while the iron content is lower. There is a demand for this special product even at a higher price. Owing to the fact that in practically all the Arizona fiber the harsh and soft material are so intermingled that it is difficult to separate them, these fibers do not bring as high prices as the Canadian. In 1918 soft Arizona fiber was selling at $850 to $1,250 a ton, according to its length, and the harsh Arizona fiber at $350 to $600 a ton. The shorter fibers, or mill rock, have about the same value as the Canadian shorter fibers. An increase in the Arizona output may be looked for but it is not likely greatly to exceed 1,000 tons a year, which is not 1 per cent of American needs on a purely tonnage basis.

The Georgia production also supplies a special demand, and may be expected to continue. The costs are low but the grade of material is poor.

Court and Treasury Decisions.

Asbestos fiber with a slight admixture of gray rock was held exempt from duty as asbestos unmanufactured, and not dutiable as a manufacture of asbestos under the act of 1890. G. A. 819, T. D. 11828.

Carded asbestos fiber consisting of amphibole asbestos in fibrous form, white in color, and used in part by chemists for filtering acids, was likewise held exempt from duty as unmanufactured rather than as a manufacture of asbestos under the act of 1894. G. A. 3369, T. D. 16850.

Asbestos fiber, invoiced as "asbestic finish," which had been separated from asbestos rock by mechanical means and containing portions of the nonfibrous rock, was held free of duty as asbestos unmanufactured rather than dutiable as a manufacture of asbestos under the act of 1897. This importation was found to consist of the

shortest asbestos fibers and not to be asbestos sponge or any form of asbestos cement. G. A. 4903, T. D. 22937.

Asbestos subjected to a process called first carding, whereby a portion of the impurities was removed, but which had to undergo two additional carding processes before the fiber was ready to be spun as carded asbestos, was held exempt from duty as asbestos unmanufactured under the act of 1909 and not dutiable as a manufacture of asbestos. Abstract 32612, T. D. 33511 (1913).

An importation invoiced as "asbestos finish," consisting of the shortest fibers of asbestos screenings, or refuse obtained in eliminating the longer asbestos fibers from the rock, and used in the manufacture of paper and cement as a filler, was held exempt from duty as asbestos unmanufactured and not dutiable as a manufacture of asbestos under the act of 1913. Abstract 41761. A later importation invoiced as "asbestos finish," "asbestos sand finish," and "asbestos ex. finish," and found to be a finely powdered by-product or refuse of comparatively little value, was likewise held exempt from duty as asbestos unmanufactured under that act. Abstract 42733.

MANUFACTURES OF ASBESTOS.

General Summary.

The rapidly growing demand during recent years, both here and abroad, for finished asbestos products has occasioned largely increased domestic production, which reached its highest level during the European War (1914–1918), when larger production was limited only by the inability of manufacturers to secure larger supplies of raw asbestos fiber. The keen domestic demand for textiles continued after the war and, as a result of the increased production and the prices prevailing, the American industry prospered greatly.

In 1919 there were 17 factories, or textile mills, in the United States engaged in the conversion of raw asbestos into finished yarns, cloths, tapes, tubings, etc. In addition to this group of manufacturers, and taking a majority of the output of the 17 factories, is another group of finishers who convert the product as it comes from the textile mills into finished articles, packings, brake linings, etc. Of the latter group there are 23 factories of importance, all located in the eastern section of the United States.

Fifteen of the textile plants are located in States bordering on the Atlantic seaboard, and one each in Indiana, Ohio, and California. Their combined capital is estimated at $15,000,000, and the value of their annual production at $35,000,000. Capital invested in the manufacture of packings, brake linings, etc., is estimated roughly at $25,000,000. The total domestic production of all classes of asbestos textiles—taking into account, in addition to the output of textile mills, the output of manufacturers using the products of asbestos textile mills as their raw material—is estimated at from $60,000,000 to $70,000,000.

The importance of the industry lies in the resistant qualities of asbestos, the component material used, which render it suitable for use where fire, oil, or acid resisting properties are essential. The finished product finds its greatest use in connection with machinery, and no substitute of equal service is known.

The importation of asbestos textiles and allied products is comparatively small and in the past has been rather supplementary to domestic production. Prior to 1914 imports came chiefly from Great Britain, Germany, and Austria. During the European War (1914–1918) Germany and Austria ceased to be factors in the American market, and since then Great Britain has practically been the only country exporting asbestos textile products to this country.

Whereas a few manufacturers of asbestos textile products also make some or all of the heavier asbestos products, such as shingles, slates, wood or lumber, paper, millboard, pipe and boiler coverings, the making of these products is generally confined to other groups of manufacturers, of which there are over 50 in the United States.

Heavy asbestos articles of foreign manufacture are sold in the United States to a small extent only, and the imports of these products come almost wholly from one factory in Canada. Products of European manufacture are practically shut off from competing in the American market by reason of transportation costs.

The United States is the world's largest producer and consumer of asbestos manufactures. The total annual domestic production of asbestos textiles and manufactured textile products alone is estimated at from $60,000,000 to $70,000,000. This does not include the heavy asbestos products, such as shingles, slates, wood or lumber, paper and millboards, and pipe and boiler coverings, the production of which amounts to several million dollars annually. Much larger amounts are exported annually than are imported. In the calendar year 1919 the total exports of all kinds of asbestos manufactures were nearly 10 times as large as the imports. According to the manufacturers, however, the exports consist mainly of corrugated paper and shingles, whereas the imports are chiefly textiles, especially yarn and cloth or tapes. An important quantity of asbestos brake and clutch linings are included in the exports of American automobiles.

Import statistics for manufactures of asbestos are compiled by United States customs officials according to the three classifications given in paragraph 367 of the tariff act of 1913, viz, asbestos yarn, woven fabrics, and all other. Exports are all compiled together under one head, "Asbestos, manufactures of."

There being practically five classes of these articles which, in process of manufacture and in resulting product, are distinctly different, separate discussion is given each in the following pages under the heads of: (1) Asbestos textiles; (2) asbestos packings; (3) asbestos papers and millboards; (4) asbestos and composition pipe and coverings, including 85 per cent magnesia coverings; and (5) asbestos shingles, slates, wood or lumber.

[3] $60,000,000 to $70,000,000 annually. Estimated, C. J. Stover, Asbestos Textile Manufacturers Association; includes also products manufactured of yarns and woven fabrics.
[4] Change in rate of duty, by act of 1913, from 40 per cent to 20 per cent.
[5] Calendar year.

General Information.

TARIFF ACT OF 1913.

Paragraph 367.—Manufactures of * * *, asbestos * * *, or of which these substances, or any of them, is the component material of chief value, not specially provided for in this section, 10 per cent ad valorem; yarn and woven fabrics composed wholly or in chief value of asbestos, 20 per cent ad valorem.

DESCRIPTION AND USES.

Asbestos textiles are valued chiefly on account of their heat-resisting qualities and their durability.

The basis of all asbestos textiles is asbestos yarn. This yarn is made from asbestos crudes and fibers, often mixed with cotton to add strength and lessen expense. Frequently in twisting the yarn very fine brass or copper wire is used, which gives the material greater durability under certain conditions.

Practically all of the asbestos yarn is made by doubling two or more strands of spun asbestos together, as single yarns are not very satisfactory, owing to the fact that asbestos fibers are so lacking in uniformity that an even twist can not be given throughout the entire length of a single yarn. As many strands can be twisted together as may be desired—up to eight ply.

A standard method of numbering asbestos yarns was adopted by asbestos manufacturers of the United States in 1907 by which the number of yards per pound divided by 100 indicates the number of the yarn. Thus, yarn running 100 yards per pound would be No. 1; 200 yards per pound, No. 2; and so on up to 3,000 yards per pound for No. 30. British standards of asbestos yarns are arbitrary and do not compare with these numbers.

The yarn is woven into cloth, tape, and listing, from which are made theater curtains, gloves, clothing, high-pressure steam packing, bushings, gaskets, brake-band linings, tubing. The cloth is used for filtering acids, alkalies, gases, etc. One of the most recent uses of asbestos cloth is in the making of noninflammable mail bags for the aerial mail service.

Tapes or linings are used for brake-band linings, for insulating armatures and field coils, for wiping tin plates, for insulating pipes on locomotives, etc.

Tubings are used chiefly for primary electric cable insulation.

Brake-band linings are used on automobiles, trucks, tractors, hoists, cranes, etc., where high friction resistance and nonburning material are needed. They may be made from tapes woven from asbestos metallic yarns, or of asbestos cloth, frictioned, folded, and stitched.

Steam packings are used wherever steam is generated and transmitted for the packing of piston rods, stuffing boxes, for gasketing flanges, manholes, handholes, etc., also in connection with pumping machinery, handling oils, acids, alkalies, and gases.

Importance of asbestos in textiles.—Asbestos is noteworthy as being the only known mineral possessing a fiber which can be spun into

yarn and woven into cloth. Its fire-resisting properties are not found in any other material. The articles mentioned are practically indispensable for their particular purposes; without them industry would be seriously handicapped. For such purposes there is no substitute.

DOMESTIC PRODUCTION.

Accurate data on domestic production are not at hand. Statistics for the industry by the United States Census Bureau do not give separate data for the textile branch of the industry. It is known, however, that this branch of the domestic industry has had an extensive development in recent years.

There are 17 establishments in the United States making yarns, woven fabrics, tapes, tubing, etc. The capital investment in 13 of these establishments is estimated at approximately $15,000,000 and their annual output at $35,000,000 at factory.[1]

In making the above estimate only those concerns engaged in the conversion of raw asbestos into finished yarns, cloths, tapes, tubings, etc., were considered. In addition to this group and including the major production of the 17 establishments is another group of finishers, such as the large manufacturers of packings, brake linings, etc. These concerns take the product of the textile mills and convert it into ordinary articles of commerce. It is estimated that the value of finished products ultimately sold to consumers by finishers of brake linings, packings, etc., together with that part of the textile production sold direct to consumers by textile producers, amounts to approximately $60,000,000 to $70,000,000.

Materials.—The principal raw material used in the manufacture of asbestos textiles is asbestos, crude and mill fiber, though cotton, flax, rubber, and copper and brass wire are employed in connection with asbestos in the manufacture of some articles.

"Unmanufactured" asbestos, as it comes on the market, has been separated from adhering rock and is composed of fibers graded according to length. The longer fibers that can be picked out by hand are sold as "crude." Crude asbestos is divided into two grades, fibers over three-fourths inch long and fibers from five-sixteenths to three-fourths of an inch in length. The flaky fibrous substance that impregnates the rock in asbestos deposits is found in much larger quantities than the crude and makes up the greater part of the production. This is separated by a process of milling and is generally known as "fiber" or "mill fiber." Mill fiber is separated into three grades, Nos. 1, 2, and 3. Of these three grades only No. 1, by virtue of having the longest fiber, is suitable for spinning. The other two grades are used for paper stock.

Canada has always been the chief source of supply, though a considerable portion of the spinning fiber is mined in South Africa and in Arizona. In 1918 the United States received about 95 per cent of the total Canadian marketable production, or 134,813 short tons. From 2 to 4 per cent of the Canadian asbestos consists of the crude grades. The amount of marketable Canadian asbestos from the mill

[1] Data secured by correspondence.

rock (that remai ing after the crude has been extracted) will average from 7 to 10 per cent.[2]

Considerable quantities of asbestos have of late years been obtained by this country from Africa. The African mineral is of two distinct types: Crysotile or serpentine, a white asbestos produced in Rhodesia, and crocidolite, a blue asbestos produced in Cape Colony. The white mineral has exceptionally long, strong, fibers, which are used in spinning. Blue asbestos, on the other hand, forms the basis of a durable non-heatconducting pipe covering, while as a filtering material, jointing and packing, in connection with acid plants, it is unexcelled. Recent developments have demonstrated the adaptability of blue asbestos fiber to spinning operations. Practically all the importation from South Africa consists of crude fiber.

Arizona asbestos is classified as (1) fine, soft, silky, spinning fiber of first-class spinning quality, or (2) as harsh fiber not suitable for textile manufacture. Although the second grade may have great length, it is harsh and brittle, and when put through textile processes creates a good deal of "splint," which makes a rough looking yarn, altogether unsuited for textiles of the finer grades. The smaller percentage of iron contained in the best grade of Arizona fiber, when compared with Canadian fiber, makes the Arizona asbestos especially useful for electric insulation.

Small quantities of asbestos were imported annually from Russia prior to 1916. Though Russian asbestos deposits may be regarded as second only to those of Canada, conditions since the war for the time being have practically cut off supplies from that source.

Receipts of crude and mill fiber during the war were insufficient, and for several years after the war available asbestos has been barely sufficient to take care of the demand. Over 99 per cent of the available supply comes from Canada and South Africa. Other accessory materials are obtainable in sufficient quantities from American producers and jobbers.

Equipment.—All machinery employed by asbestos manufacturers in this country is of American make, and in quality is fairly comparable to foreign machinery. European manufacturers to a large extent employ second-hand cotton machinery, or cotton-waste spinning machinery. English manufacturers make more use of cotton-waste methods in spinning than do American manufacturers.

Methods of production.—Practically the same methods, with but minor differences, adopted in general textile operations are employed in producing asbestos textiles. Power and automatic machinery are used in about the same proportion as in yarn and cotton mills.

No child labor is employed in the domestic industry. Male labor is used in crushing, mixing, and calendering, and considerable female labor in spinning and twisting. There is little hand labor.

Organization.—The efficient conduct of the industry requires a minimum investment for each factory of approximately $200,000 to $300,000 and considerable free capital for the purchase of raw materials and the extension of credit.

Although the market for asbestos textile products is confined chiefly to the engineering trades, it is relatively large and expanding rapidly.

[2] Canadian Mining Journal, Mar. 1, 1918, p. 90.

Geographical distribution.—There are seven asbestos textile plants in Pennsylvania, two in Massachusetts, two in New Jersey, two in South Carolina, and one each in North Carolina, Indiana, Ohio, and California.

Domestic production and consumption.—The manufacture of asbestos textile products comes, properly, under two heads: (1) The conversion of unmanufactured asbestos into yarns and the weaving of yarns into cloths, tapes, tubings, etc.—products of the textile mills and, (2) the making of various articles from products of the textile mills.

Official statistics of domestic production are not available. An estimate in 1920 places the annual production of the former group at $35,000,000, and of the two groups combined at $60,000,000 to $70,000,000.[3] To avoid duplication in arriving at the latter figure, consideration was given only to the amounts sold direct to consumers by each of the two groups.

The production capacity of American manufacturers is sufficient to supply domestic demands, and curtailment of production has been occasioned only by insufficient supplies of raw materials.

The consumption of asbestos products per capita in the United States far exceeds that of any other country, and it is generally accepted that the total American consumption is greater than the combined consumption of all other countries. Fully 50 per cent of the output of asbestos textiles in the United States is consumed in the automobile industry.

Domestic exports.—Separate statistics of exports of asbestos textiles are not available, these articles being included by customs officials with other kinds of asbestos manufactures. Exports of all kinds of asbestos manufactures were first recorded in 1910, amounting in that year to $293,616. During the following years, except 1914 and 1915, there were substantial annual increases which reached the maximum of $3,569,932 in the fiscal year 1920. The large demand for asbestos products abroad during the war continued after the cessation of hostilities.

The United States exports substantial amounts to many foreign countries, including practically all countries of importance. The largest amounts, however, go to Canada, Cuba, and the United Kingdom.

Customs export records have never differentiated between various kinds of asbestos manufactures, but it is believed that there has never been any considerable volume of exported asbestos textiles.

FOREIGN PRODUCTION.

The principal foreign countries producing asbestos textiles are England, Germany, Austria, and Italy. England is by far the most important.

Capital invested in the industry in foreign countries is stated, by American manufacturers, to be approximately as follows: England, $25,000,000; Germany, $14,000,000; Austria, $25,000,000; and Italy, $1,000,000.[4]

In textile goods British manufacturers have maintained a high standard of efficiency, due to their greater experience in the manu-

[3] Data from correspondence in Tariff Commission's files.
[4] C. J. Stover, American Asbestos Manufacturers Association.

facture of textiles and their supremacy in the spinning of yarn. Germany, chiefly by virtue of cheap labor, was able to meet competitive conditions and produce yarn on a large scale. The output per machine was less, and the quality was generally inferior to that of British make. Mules were employed to a considerable extent enabling the use of somewhat shorter fiber, but Germany was unable to compete with the British spinners in the same quality of product.

British manufacturers are large users of Rhodesian fiber, which is much cheaper than Canadian—the fibers chiefly used in America. American manufacturers prefer the Canadian asbestos because they have found it easier to spin. The Rhodesian fibers, being exceptionally smooth, incline to slip by one another when twisted in the spinning operation. British spinners have overcome the difficulties in spinning this material by mixing it with a small percentage of Canadian fiber to increase the friction.

One or two American manufacturers use Rhodesian fiber, but broadly speaking they are dependent upon Canadian asbestos for their raw material, whereas, it is estimated,[5] 60 to 80 per cent of the spinning fiber used in England is Rhodesian and South African.

On account of the difference in grading, it is impossible to make a detailed comparison of the cost of Rhodesian and Canadian fibers. It may, however, be said that No. 1 Rhodesian is practically equal to No. 2 Canadian crude, and sells for from 30 to 50 per cent less per ton. A machine will spin practically the same lengths of Rhodesian and Canadian yarns per day, but the weight of the product from Rhodesian material is about 20 per cent less. Since yarn is usually sold by weight, the apparent output is reduced by one-fifth when operating in Rhodesian fiber in spite of the fact that Rhodesian fiber actually runs a little faster through the cards, due to its greater flexibility and freedom from dust.[5]

Of the eight firms in the United Kingdom that spin asbestos yarn the three largest furnish the bulk of the output. These firms also engage in the manufacture of heavy products, such as slates and millboards, as well as packings, coverings, and finished textiles. All three of these firms own mines in Rhodesia or South Africa and can bill their own consumption at cost.

Definite statistics of recent English production are difficult to secure, and the last official English census was taken 13 years ago—in 1907. A personal investigation of the situation in England by an agent of the Tariff Commission indicates that the total output of all classes of asbestos products is several times larger in the United States than in England.

IMPORTS.

The largest importations of asbestos textiles made in any fiscal year prior to the war occurred in 1914 ($114,978). After the beginning of hostilities in Europe (August, 1914) imports decreased greatly, reaching their lowest point in the fiscal year 1918 ($7,918). After the cessation of hostilities a speedy recovery took place, so that by the expiration of the fiscal year 1920 the importation ($411,048) was larger than during any previous 12 months period. The larger

[5] Paul M. Tyler, special agent to England of the United States Tariff Commission.

amount was due somewhat to increased prices but mostly to the larger quantities of both yarn and woven fabrics imported.

In recording imports by countries, American customs officials do not distinguish between textiles and other products of asbestos. Official import statistics, however, indicate that of asbestos manufactures of all kinds imported the United States received by far the largest amounts from England—France and Canada being the only other countries of importance—the percentages for these three countries of the total in 1919 being 63, 21, and 16, respectively. Prior to 1915 the principal countries of origin in order of importance were England, Germany, and Austria-Hungary.

Imports of asbestos textiles are largely due to greater cheapness of the foreign article.

PRICES.

Comparison of American and British yarns is extremely difficult, since different ratings are used. Yarns, however, are sold by weight in both countries.

Asbestos metallic yarns of closely similar quality sold in the United States in October, 1919, at 85 cents per pound, and in England at 45 to 50 cents per pound. Prices of other textiles products in England on the same date averaged roughly one-half those obtained in the United States with some as low as one-third the price in the latter country. The prices given in the statistical tables *infra* are for uncontracted lots and do not represent the prices received by manufacturers for the bulk of their product which is sold generally under contract at much less (frequently 25 to 40 per cent) than the quoted prices for small lots.

TARIFF HISTORY.

No tariff changes were made in the duty on asbestos manufactures of all kinds (25 per cent ad valorem) from 1883 to 1909.

The act of 1909 distinguished between woven fabrics and other manufactures of asbestos, and raised the duty on the former product from 25 per cent to 40 per cent ad valorem.

The act of 1913 separated all asbestos textiles from other asbestos products by specifically mentioning "yarn and woven fabrics composed wholly or in chief value of asbestos" and the duty was fixed at 20 per cent. The duty on manufactures of asbestos was reduced to 10 per cent. In the fiscal year 1914, after the new law had been in operation only 9 months, the value of imports increased 22 per cent and the revenue derived decreased 28 per cent.

COMPETITIVE CONDITIONS.

Among the branches of the asbestos industry, foreign competition in the American market is keenest in textiles. These products are costly and transportation is a minor item. Practically the only foreign manufacturers who have sold any considerable quantity of asbestos products in the United States are those of England and Germany. After 1914, during the World War, Germany was not a factor in the trade. Even so late as the spring of 1921, German

producers had not resumed the manufacture of asbestos products on an extensive scale. England is the chief competitor of this country.

The methods of manufacture in the United States and England are practically the same, but American machinery is run at greater speed and the output per operative is greater in this country. However, the gain in production is partly offset by more rapid depreciation of machines.

British manufacturers have some advantage in the production of asbestos yarn, chiefly on account of their more extended use of Rhodesian or South African fiber which costs less in the open market than the Canadian. Moreover, since the three largest producers of asbestos manufactures in England are mine owners (in either Rhodesia or South Africa) they can bill the raw material to themselves at cost. Rhodesian and South African fiber is procurable in the United States at practically the same price as in the open market in England and is much cheaper than Canadian fiber which is used almost exclusively by most American manufacturers. The use in this country, however, of Rhodesian and South African fiber has increased rapidly in the last two or three years as American spinners have gained experience in the manipulation of the smoother fiber. The British advantage as regards raw material costs will tend to disappear, since it is chiefly due to the larger substitution of Rhodesian asbestos for the more costly Canadian material. American establishments owning mines in Canada are not as subject to these conditions as are those which do not own mines. With the wider adoption of Rhodesian fiber Canadian producers may be forced to reduce prices to meet competition not hitherto experienced.

British manufacturers express the opinion that they can not compete with manufacturers in the United States, but may sell certain products in the United States, provided domestic manufacturers maintain prices at levels which bear no relation to cost of production. British prices are from two and one-half to three times higher than they were before the war, whereas American prices, which in 1914 were not greatly higher than British prices, plus the duty of 25 per cent, are now from two to three times those obtained in England. The profit in the turnover of British plants was recently estimated to average about 15 per cent.[6]

It is announced that Turner Bros. Asbestos Co. (Ltd.), one of the largest British firms, is to build a plant in the United States. That company claims that the cost of producing yarn and other asbestos products in the United States is much less than the combined cost of producing these articles in England and shipping them to this country. It is said that the construction of the plant is only delayed by difficulty in getting building material and labor.[6]

It is given as the opinion of United States manufacturers that some understanding exists between English manufacturers whereby English textiles are offered in the United States at lower prices than are asked for the same goods in England, for instance, that an article selling in England at 70 cents is offered in the United States at 60 cents. It is further stated that instead of making, say, 20 per cent profit in England, English manufacturers will sell for a profit of

[6] Paul M. Tyler, special agent to England of the United States Tariff Commission.

10 or 5 per cent, and sometimes without profit, to users in the United States.

Definite statistics of wages paid in the asbestos industry are not available. Wages paid in the past in the manufacture of asbestos textiles were lower in England than in the United States. The different processes employed in the manufacture of asbestos and cotton textiles are almost identical and wages paid in the latter industry indicate to a certain extent the rates paid in the asbestos industry.

About two-thirds of the operatives in the English asbestos textile mills are women. In April, 1921, the standard wage for the chief classes of workers in spinning and weaving was 45 to 50 shillings per week of 48 hours, but this was later reduced, in at least one establishment, to 36 shillings (about $7.20). About one-third of the workers are men whose wages, at the same time, ranged from £3 12s. to £4 (about $14 to $16) according to the character of work performed. Loom fixers and machinists were earning from £4 to £4 10s. (about $16 to $18). Eighty-spindle machines are used for spinning, each operator (female) tending one bank of 40 spindles. The speed is regulated by the strength of the fiber. British asbestos workers have no separate organization but most of them are members of the National Union of General Workers which has a membership of some 1,250,000 among more or less unskilled workers in a wide range of trades. The British manufacturers formed a pool for the purchase of raw materials and assisted in the production of munitions during the war. In 1920 this pool was revived and promises to be an important factor in the trade as it comprises all but one of the manufacturers and controls fully 90 per cent of the product. Its functions are to regulate prices, to act as an Employers' Association in dealing with the workers, and otherwise to promote joint interests. Price reductions made in the spring of 1921 were drastic and, in many cases, the products were selling at materially less than production costs.

1913....	367	Manufactures of * * * asbestos, * * * or of which these substances or any of them is the component material of chief value, not specially provided for in this section.	10 per cent ad valorem.
		Yarn and woven fabrics composed wholly or in chief value of asbestos.	20 per cent ad valorem.

Court and Treasury Decisions.

Woven fabrics composed wholly or in chief value of asbestos with a border to bind the edges, were held to come within the second clause of this provision in the act of 1909 for woven fabrics composed wholly or in chief value of asbestos, and not within the first clause as manufactures of asbestos. (United States *v.* Grasselli Chemical Co., 5 Ct., Cust. Appls., 320.) *Asbestos yarn* is dutiable under this paragraph and not free under paragraph 406 as unmanufactured. (Abstract 39424.)

ASBESTOS PACKINGS.

General Information.

TARIFF PARAGRAPH, ACT OF 1913.

PAR. 367. Manufactures of * * * asbestos, * * *, or of which these substances or any of them is the component material of chief value, not especially provided for in this section, 10 per cent ad valorem.[7]

[7] Includes all asbestos manufactures except yarn and woven fabrics.

DESCRIPTION.

Asbestos packings are of two general types or classes.

Class 1.—Included in this class are all packings made from crudes and fibers by regular standard textile practice, viz, crushing, mixing, carding, spinning, weaving, treating. There are several different kinds of such packings:

(*a*) *Wick or rope packings* are made from rovings produced by ordinary carding machinery, the rovings being twisted to the desired diameter and density on wick and rope making machinery. They are used for emergency packings, for wiping tin plate, sheet steel, and other metals during the cooling period, and for general packing purposes in and near hot surfaces.

(*b*) *Braided or twisted packings* are made of asbestos yarns, the yarns being twisted or braided on machinery employed throughout the general textile industry for such purposes. Braided or twisted packings are frequently graphited and lubricated. They are used for packing valve stems, small piston rods, and small stems of angle and globe valves, sight-feed lubricators, and the like.

(*c*) *Laid or high-pressure steam packings* are made from asbestos cloth, rubber treated, cut to size in strips and laid or wound to desired finished size, either square, round, or oblong, and with or without rubber, wire, lead, or core. These are employed for general packing purposes, such as piston rods, stuffing boxes, and the like, especially in service using high pressure and superheated steam.

(*d*) *Gaskets* are made from rubber-treated asbestos cloth, cut in strips, folded, and formed to shape and size desired. They may be folded and tape jointed, or they may be made from asbestos tubings, the latter being known as seamless gaskets. Gaskets are used to seal joints on manhole or handhole openings of boilers, and at flanges in pipe lines, also at ports of gasoline motors.

Class 2.—In this class are packings and gaskets made from compressed sheet. This compressed sheet is fabricated by mixing short asbestos fibers with binding and filling materials. By compressing and a semivulcanizing process, a product, tough, semiresilient, and of the desired size and thickness is obtained. Compressed sheet packings are used for a great variety of purposes, principally for jointings in connection with internal-combustion motors.

These packings are also employed for emergency uses, the engineer preferring to cut gaskets from a sheet of compressed packing rather that wait to secure gaskets of a given size from a supply house.

Asbestos paper and millboard are used in considerable quantities for very hot joint packing in gas stoves, exhaust pipes, furnace covers, and other types of joints. The first cost of asbestos paper and millboard is less, but it is inferior to the regular compressed sheet packing.

No important substitutes for asbestos packings are known, asbestos being the only permanent, elastic, heat resisting, and generally satisfactory material available for such purposes.

DOMESTIC PRODUCTION.

The capital invested in the manufacture of asbestos packings in the United States is roughly estimated at $25,000,000, and the value of the annual output at factory at $25,000,000. The Priorities Division

of the War Industries Board gave manufacturers in this industry class 4 rating, in 1918.

Materials.—The principal raw materials are asbestos yarn, asbestos cloth, asbestos fiber, rubber, and filler (china clay or similar material).

Asbestos yarn and cloth are obtained from domestic manufacturers of these articles and from Europe—principally England, Germany, and Austria, The grade of asbestos fiber employed in making compressed sheet packings is obtained chiefly in Canada, though some is imported from South Africa and relatively small quantities are mined in Arizona. Rubber and accessory materials are obtained in sufficient quantities in the United States.

Supplies of asbestos yarn, asbestos cloth, and asbestos fiber available and in sight are not always sufficient to take care of the demand. The United States is dependent on British-controlled territory for most of its supply of raw asbestos, as fully 99 per cent of the available supply is mined in Canada and southern Africa. There are extensive deposits of asbestos in Russia, and before the European war the United States received small amounts from that country annually, but after 1915 conditions in Russia became such that all exportation to the United States ceased.

Equipment.—All machinery employed in the domestic manufacture of asbestos packings is made by American machinery manufacturers and in point of quality is fairly comparable to foreign machinery.

Methods of production.—Practically the same methods, with minor differences, are employed in the industry as in general textile operations. All asbestos cloth used in the manufacture of packings is impregnated with rubber cement. Power and automatic machinery are used in about the same proportion as in general textile mills.

Production is limited to some extent by the inability of American manufacturers to obtain at all times sufficient supplies of asbestos yarn. This condition is directly traceable to the limited supplies available of asbestos, crude and fiber, for which American manufacturers are almost wholly dependent on foreign sources.

In the United States no child labor is employed. All work is done in the factories. Little hand labor is employed, and there is about the same use of skilled labor as in general textile mills.

Organization.—The efficient conduct of the industry requires a minimum investment of from $5,000 to $10,000 and considerable free capital for the purchase of raw materials and the extension of credit.

The market for asbestos packings is confined almost wholly to the machinery trade. It extends to all parts of the United States and to foreign countries.

The capital invested in the American industry, roughly estimated at $25,000,000, is divided among numerous concerns, some of which are also engaged in other branches of the asbestos industry.

Geographical distribution.—The manufacture of asbestos packings is carried on mostly in States on the Atlantic coast. There are seven principal factories in Pennsylvania, six in New York, three in New Jersey, three in Ohio, and one each in Indiana, Connecticut, North Carolina, and South Carolina.

History of the industry.—The American industry had its beginning in a very small plant in Connecticut about 35 years ago. From this beginning it has grown to about 23 important plants and numerous small concerns manufacturing chiefly other products.

Domestic exports.—Official statistics of the Department of Commerce do not show separate compilations of exports of asbestos packings. Some packings are being exported, but data showing amounts or destinations are not available.

FOREIGN PRODUCTION.

Prior to the World War Germany, England, Austria, and Italy, in the order named, were the principal foreign producing countries, Germany being by far the most important. In style, size, and class foreign-made packings are similar to and in quality they compare favorably with American packings.

IMPORTS.

In compiling import statistics United States customs records do not differentiate between asbestos packings and "other manufactures of asbestos." Imported amounts of asbestos packings therefore are not definitely known. However, it is the general opinion among manufacturers and importers of these articles that asbestos packings are imported to a much less extent than asbestos yarns and woven fabrics, the total imports of which from 1915 to 1919 averaged slightly more than $26,000 annually.

Prior to 1915 foreign asbestos packings were received chiefly from Germany, England, Austria, and Italy; after that year the war stopped exports from Germany, Austria, and Italy for the time being, and only England continued to ship to this country.

PRICES.

Comparable prices of certain classes of domestic and foreign asbestos packings are not available.

Prices of asbestos packings in both domestic and foreign markets closely follow the prices of asbestos yarns; thus, when asbestos yarns are selling at, say, 85 cents per pound, asbestos packings also sell at 85 cents per pound. The additional cost for labor in manufacturing and distributing packings is compensated for by the reduced cost of raw material in the finished product through the introduction of cheap filler compounds with the higher-priced asbestos.

That asbestos packings sell at much lower prices in England than in America is indicated by the price of yarns in the two countries. Asbestos yarns closely similar in quality sold in the United States in October, 1919, at 85 cents per pound and in England at 45 to 50 cents per pound.[8]

TARIFF HISTORY.

Asbestos packings have never received special mention in any of the tariff acts.

As no records are in existence showing annual importations it is not possible to discern the effect of the lower rate of duty on the volume imported or the revenue produced. It may be said, however, that as late as 1920 domestic production had not been checked by reason of the lower duty on imports of foreign packings into the United States under the act of 1913.

---

[8] For prices of asbestos yarns see page 36.

COMPETITIVE CONDITIONS.

American manufacturers of asbestos products are almost entirely dependent upon foreign sources for crude asbestos. Most of this they obtain in Canada; the rest in Rhodesia and South Africa. Prior to 1915 small amounts came from Russia, but this source of supply has been cut off for the time being. America uses nearly all of the Canadian output. It was reported in 1918 that more than 95 per cent of the total Canadian production of asbestos was brought to the United States.[9]

The principal foreign competing countries—Germany, England, and Austria—are not better supplied with deposits than the United States, though the world's principal asbestos deposits are in British-controlled territory—Canada, Rhodesia, and South Africa. There are no asbestos deposits in the British Isles, and English manufacturers import practically all the mineral from South Africa. Asbestos mined in Germany is suitable only for the manufacture of asbestos pulp,[10] and, although the occurrence of asbestos in Austria has been reported,[11] so far as ascertained no asbestos is mined in that country. Both Germany and Austria receive their supplies of the mineral mainly from Rhodesian and South African deposits.

It has been possible to import foreign packings for less than prevailing prices asked for American packings of similar grade. Nevertheless domestic manufacturers have experienced little difficulty in disposing of their products at remunerative prices, although foreign packings are said to be as good in quality as, and in some cases better than, American packings.

In recent years England has been the only country from which packings have been shipped to the United States, but the quantities have been comparatively small and largely supplementary. The lack of severe English competition in the United States may be attributed to the great demand in English, colonial, and near-by European markets.

Germany and Austria, formerly the largest manufacturers of asbestos packings, have been practically out of the American market since 1914. In Germany, at the outbreak of the war, stocks of raw asbestos were small. Imports were cut off and large supplies were necessary during the war. Since the war small quantities received from Holland and Switzerland have been inadequate to meet the demand. Supplies can be secured in other countries, but deliveries are extremely slow and prices so high that the prospect of German packings entering into competition with the American product in the United States is remote. In Austria the situation in the asbestos industry is similar to that in Germany.

Other competitive conditions in the asbestos industry are outlined in the Tariff Commission's surveys on "Asbestos, crude" and "Asbestos textiles."

TARIFF CONSIDERATIONS.

Although a large part of the asbestos packings imported are made of *asbestos woven fabrics* further advanced in manufacture by being shaped and coated with rubber or other materials, they enter the

[9] J. S. Diller in "Asbestos in 1918," published by the U. S. Geological Survey.

Court and Treasury Decisions.

Asbestos packing, not woven, comes within the 10 per cent rate in paragraph 367 of the act of 1913 as manufactures of asbestos, under the practice of customs officers at New York.

ASBESTOS PAPERS AND MILLBOARDS.

General Information.

TARIFF PARAGRAPH, ACT OF 1913.

Par. 367. Manufactures of * * *, asbestos, * * * or of which these substances or any of them is the component material of chief value, not specially provided for in this section, 10 per cent ad valorem.

DESCRIPTION.

Asbestos paper, as the name implies, is a paper made from asbestos fiber. It varies in thickness from about one one-hundredth to one-eighth inch. Thicknesses up to and including one-sixteenth inch are known as asbestos paper, and three thirty-seconds and one-eighth inch thicknesses are spoken of as "rollboard." The width is generally 36 inches, and the paper is put up in rolls weighing approximately 100 pounds each.

Asbestos millboard is made of asbestos fiber with a small percentage of cementing or sizing material, built up in thin layers in a manner similar to paper, in sheets 42 by 48 inches, and usually from one-sixteenth to one-half of an inch in thickness.

The chief uses of asbestos paper and millboard are for high-pressure gaskets and packings, insulations, lining for stoves, air-cell pipe covering, roofing, building paper, and other purposes in the building trades. Probably the largest consumption is for wrapping hot-air furnace pipes and risers, and for steam pipe coverings.

Insulating material made of 85 per cent magnesia and 15 per cent asbestos; also hair felt, cork, and wood felt are competing articles for pipe coverings. Ordinary building paper, tar paper, etc., may also be considered substitutes for asbestos paper in building construction where fireproofing is not essential.

DOMESTIC PRODUCTION.

The United States Census Bureau reports that in 1914 there were 10 establishments in the United States manufacturing asbestos building materials—slates, sheathing, siding, air-cell covering, flooring, etc.—and other articles such as mats, pads, holders for sad irons, rings, tapes, yarns, cloths, packings for ice boxes and refrigerator cars, friction and transmission facings and linings, and other asbestos manufactures. As reported by the census for these 10 establishments, the total capital was $2,723,000; the value of the products, $1,813,000; and the industry gave employment to an average of 651 employees with annual wages amounting to $329,000. The Tariff Commission, however, is credibly informed that in 1914 at least 30 establishments manufactured these products and one concern alone reports that it employed 650 workers in that year.

Asbestos paper and millboard occupy an important place in the asbestos industry. The manufacture of these articles is desirable owing to the fact that it permits the utilization in the same plant of short fibers and waste from spinning operations. The uses are varied and the products find ready sale on account of fire-resisting properties and insulating efficiency.

Raw materials.—Asbestos paper is composed of from 90 to 95 per cent asbestos fiber and from 5 to 10 per cent binding material, consisting of starch, flour, cold-water paste, clay, or other fillers.

Because of the greater cost of long asbestos fibers, only the short-fiber grades which are not suitable for spinning (ordinarily termed "paper stock") are used. These fibers are generally less than one-half inch in length, the average being approximately one-fourth inch. Shorter grades make an inferior paper, resulting in considerable breakage in the finished article.

Nearly all the pulp fiber used in the United States is imported from Canada free of duty.

Methods of production.—Raw asbestos fiber, scrap asbestos, binding material, and water are placed in a beater and agitated until the fibers are separated and a smooth consistent pulp is obtained. From the "beater" the material is discharged into a "stuff chest" of large capacity, in which the pulp is constantly agitated, so that as new "beater" lots are fed into it a uniform mixture is made and small variations in individual "beater" lots are prevented from appearing in the finished paper. From these "stuff chests" the pulp is pumped into regulating boxes which control the quantity fed to the paper machine. From the regulating box the pulp goes to the "flow box," where additional water and the overflow from the "wet end" are added to bring the pulp to proper consistency for feeding into the "wet end." This "flow box" also serves to settle the sand and hard particles regularly found in commercial asbestos fiber as it comes from the mines. The pulp then proceeds to the "wet end," where it is deposited on revolving, screen-covered cylinders and in turn transferred from these cylinders to a continuous woolen felt. The number of cylinders used, together with the speed of the machine and consistency of the asbestos pulp, determines the thickness of the asbestos sheet. A second woolen felt is fed over the first, so that the pulp lies sandwiched between, and the surplus water is then squeezed out of the pulp by means of heavy press rolls which mat the fibers

together. At the end of this "wet end" the continuous sheet of wet asbestos paper passes over a long bank of steam-heated cylindrical driers. The moisture is gradually driven out of the wet paper by these driers and the dry sheet of asbestos paper is obtained.

The sheet, usually 74 inches wide, is wound on storage rolls. From these large rolls the sheet is led through slitters which cut it into 36-inch widths and then to the rewinders, where it is wound into rolls of approximately 100 pounds each. These rolls are taken off, wrapped, and headed and are ready for the market.[12]

In manufacturing asbestos millboard entirely different machines are used. The original mixture is similar, but continuous drums are not employed. The board is built up on a rectangular screen. When the required thickness is obtained, the material is partly dried by squeezing in a hydraulic press. It is then stored in a drying room.

In either case the direct labor involved is comparatively small, although somewhat greater in producing millboards. The methods of manufacture in the United States and in England are almost identical. Similar methods are doubtless employed in other foreign countries.

Organization.—In 1920, asbestos paper was manufactured by 10 concerns in 14 factories located in the States of Pennsylvania, Ohio, Massachusetts, New York, New Jersey, Maryland, and Wisconsin.

History of the industry.—The manufacture of asbestos paper began commercially about 40 years ago, but its principal development has taken place during the past 25 years. Many experiments were made to manufacture suitable asbestos printing paper, but on account of the difficulty of obtaining a smooth and even surface and the tendency of the material to absorb ink, like blotting paper, it was found to be not well adapted for this purpose. Early uses of asbestos paper were for ornamental wall paper and carpet linings. None of these uses has been developed in a practical way, but the manufacture of asbestos paper has become a very important industry and it has found extensive uses in ways that were not foreseen by early investigators.

The first paper made in the United States was manufactured by John Roberts & Son Co., in 1876, in a mill near Waltham, Mass. The material first used was imported from Italy. About three years later Canadian fiber was introduced; the shorter grades of fiber which would otherwise be wasted were used for the manufacture of paper and millboard and proved to be very satisfactory. For several years the product of this mill was sold through Rice Kendall, of Boston, Mass. From 1881 to 1900 the H. W. Johns Co., of New York, took the entire product, which was 300 to 700 tons a year. The latter company built their own asbestos mill at Brooklyn, N. Y., in 1900. Keasby & Mattison Co., of Ambler, Pa., began to manufacture in 1897. Other early manufacturers were the Asbestos Paper Co., at Baldwinsville, Mass., and B. S. Binney, at Shirley, Mass.

Domestic production and consumption.—Production in the United States has made tremendous strides, some plants manufacturing as much paper in a day as was made in an entire year 25 years ago. The average domestic production in the last three or four years has

[12] From "Asbestos," published by Secretarial Service, Philadelphia, Pa., January, 1921.

been about 25,000 to 30,000 tons a year, and the present plant capacity is much greater than these figures indicate.

The bulk of the output is consumed in this country, and the existing domestic manufacturing capacity is adequate to supply normal demands.

Domestic exports.—Official statistics of exports do not distinguish between the various classes of asbestos manufactures, but it is known that the bulk of the exports under this classification consists of asbestos shingles and corrugated sheathing which are sold chiefly in Canada and Latin American countries. The statistical tables of exports of all classes of manufactured asbestos are given in the discussion of asbestos textiles, supra.

FOREIGN PRODUCTION.

Among the foreign producing countries only Canada, Great Britain, and Germany are of importance at the present time in the manufacture of asbestos paper and millboard. Of these Canada is the only country in a position to compete successfully in the domestic market. However, that country has but one small plant manufacturing this product, whereas in the United Kingdom there are eight firms that manufacture asbestos paper and millboard in connection with other asbestos products and two firms that manufacture only heavy asbestos products under which paper and millboard are classed. Heavy asbestos products of European origin are, however, practically eliminated from the American market because of transportation costs.

IMPORTS.

Official statistics of the quantity and value of asbestos paper and millboard annually imported into the United States are not available. Only small quantities of these articles made in foreign countries are sold in this country and are the output of one Canadian mill.

PRICES.

Prices quoted on asbestos millboard are usually the same as the prices quoted on asbestos paper, and vice versa, and vary but little from month to month during the year.

Prices paid in 1920 by consumers for commercial grades ranged from $10 to $15 per 100 pounds in January, from $12 to $18 during February to November, inclusive, and $10 to $18 in December. For special grades the prices ranged from $15 to $35 per 100 pounds in January, $17 to $40 from February to May, inclusive, and $17 to $35 from June to December, inclusive.

Prices of the Canadian products are practically the same as those obtaining in the United States, whereas British prices usually range somewhat lower. In January, 1920, the price of millboard in England was £55 per ton of 2,000 pounds, or approximately $10.45 per 100 pounds (exchange at $3.80).

TARIFF HISTORY.

Asbestos paper and millboard have never been specially mentioned in any of the tariff acts.

COMPETITIVE CONDITIONS.

In the manufacture of asbestos paper or millboard the main item is the cost of raw material—short asbestos fiber. Canadian fiber is the only variety that is used to any extent for this purpose either in the United States or Europe. South Africa and Rhodesia do not export any quantity of material suitable for the manufacture of these articles. Direct labor is a minor factor in cost, and, while some labor is needed to keep the automatic machinery in repair, differences in labor cost here and abroad are so small that they may be neglected in considering the strength of the domestic industry.

Next to raw material, transportation is probably the most important item. The freight on raw material from Canada to the United States and from Canada to Europe is nearly the same, but since most of the American factories are located near the Atlantic seaboard, they have advantages in the American market as compared with European manufacturers to the extent of the cost of shipment across the Atlantic. The development of the industry in Canada, close to the supplies of raw material, may, however, be a factor in the future. One plant has been established at Deschenes, Quebec, and is shipping some of its product into the United States.

ASBESTOS AND COMPOSITION PIPE AND BOILER COVERINGS.

GENERAL INFORMATION.

TARIFF PARAGRAPH, ACT OF 1913.

PAR. 367. Manufactures of * * *, asbestos, * * * or of which these substances or any of them is the component material of chief value, not specially provided for in this section, 10 per cent ad valorem.

DESCRIPTION.

Asbestos and composition pipe and boiler coverings are manufactures of non heat conducting and heat resisting materials used as coverings for heat generators and heat conductors. The principal ingredients are asbestos and magnesia. The coverings usually are prepared in tubes, blocks, or felt, or in a loose composition, as cement, to be applied with a trowel.

Some of the principal uses are for covering steam and hot water pipes, gas producing lines, and furnaces, in the manufacture of locomotives and stationary boilers, stoves, and ovens, as a lining for smokestacks and steel safes, and as a filler between boiler tubes.

DOMESTIC PRODUCTION.

In 1920 there were at least 36 concerns in the United States, distributed in various States from New York to California, manufacturing asbestos and magnesia coverings. The total quantity or value of the annual output is not known. The American industry, however, supplies the bulk of these articles used in this country.

Raw materials.—Asbestos fiber, asbestos paper, magnesia, and cementing material of a mineral character are the materials used. The asbestos used in the industry comes mainly from Canada and enters this country free of duty. Asbestos paper is made in this country from short asbestos fiber and a binder paste. Magnesia is produced from dolomite rock or magnesite of domestic origin. The import duty on carbonate of magnesia is 1½ cents a pound; the raw materials, magnesite or dolomite, are free of duty.

Equipment.—The machinery and other equipment used in the industry are manufactured in America in quantities sufficient to meet all requirements.

Methods of production.—Asbestos tubes are made of successive layers of asbestos paper separated by strips or dividers of the same material, forming a series of very small air spaces. The tube is made in 3-foot lengths and split lengthwise, for easy application; or of successive sheets of corrugated and flat asbestos paper cemented together, in sections usually 3 feet long, covered with canvas and split lengthwise.

Asbestos blocks and lagging are made up of asbestos fiber with cementing material on the outside surfaces to hold the fibers together, or of successive sheets of corrugated and flat asbestos paper cemented together. The blocks are usually made 3 feet long, from 12 to 14 inches wide, and from 1 to 3 inches thick. Lagging is made to templates as desired. Blocks are sometimes given a vitrifying treatment which renders the outside very hard and adds to the refractory character of the insulation.

Asbestos felt is made up of asbestos fibers, not pulped or molded, built up in layers by superimposing fiber upon fiber in sheets usually 72 inches long, 36 inches wide, and from one-eighth to 3 inches thick.

Asbestos cement is made by mixing together asbestos fiber and binding materials of a mineral character. Asbestos cement is ordinarily put up in bags containing 100 pounds. Magnesia cement, for use on irregular surfaces, is made of 85 per cent magnesia and 15 per cent asbestos, and is usually put up in bags containing 60 pounds.

Magnesia coverings consist of 85 per cent magnesia and 15 per cent asbestos fiber molded into the shapes required for insulating various surfaces.

The basic material is magnesium carbonate, which is produced in two ways: The eastern manufacturers secure magnesium carbonate from dolomite rock (magnesian limestone), which is found in large quantities in the East. The rock is first calcined and then slacked with a large volume of water. The resulting product, which consists of mixed hydrates of lime and magnesia, is next subjected to a course of saturation by carbonic acid gas (a by-product of the process), which dissolves the magnesia, leaving the lime. This magnesia solution is then filtered, boiled, and precipitated, producing pure carbonate of magnesia in the form of a fine white powder. The western manufacturers, to whom deposits of magnesite are more readily accessible than of dolomite, secure the magnesium carbonate from magnesite. The mined magnesite is first burned and then the magnesia is extracted by the process above described.[13] Asbestos fiber is added to the magnesia as a binder and to give it greater durability.

Geographical distribution.—Thomas's Register of Manufacturers, 1920, records 36 manufacturers of asbestos and magnesia pipe and boiler coverings in the United States, located in the States of New York, New Jersey, Pennsylvania, Maryland, Ohio, Illinois, Michigan, Wisconsin, Nebraska, Colorado, and California.

Domestic production and consumption.—The amount and value of the total annual production and consumption are not known. The United States is the largest consuming country of pipe and boiler coverings in the world. Some of the domestic product is exported, but most of it is consumed in this country. Manufacturing capacity is adequate for present needs, and a shortage in these articles could be caused only by a deficiency in asbestos, the supply of which comes chiefly from Canada.

Domestic exports.—Statistics are not available for exports of pipe and boiler coverings, as these articles are not separately listed by customs officials. In the calendar year 1919 the total exports of all kinds of manufactures of asbestos amounted in value to $3,531,978, the product going to many foreign countries, chief among which were Canada, Cuba, and Mexico.

FOREIGN PRODUCTION.

The United Kingdom and Germany are the largest foreign producing countries of asbestos products (among which are asbestos pipe and boiler coverings), smaller quantities being produced in

[13] From "Asbestos," published by the Secretarial Service, Philadelphia, May, 1920.

France and Italy. The annual output of the United States, however, far surpasses that of either of these countries. Magnesia is made in England only from dolomite. The output is comparatively small and the prices are about the same as those obtaining in this country. Germany is situated fairly favorable as regards magnesia supplies owing to the production of magnesium salts as a by-product of potash manufacture.

IMPORTS.

Separate statistics of imports of the above mentioned articles are not compiled by American customs officials. The amounts are included under "All other manufactures of asbestos," which embrace all imports of manufactures of asbestos other than yarn and woven fabrics.

In the calendar year 1919 "All other manufactures of asbestos" were imported to the value of $69,565, the bulk of which came from England. Imports in 1920 were on a much larger scale.

PRICES.

Asbestos and composition pipe and boiler coverings are sold at discounts from the 1907 pipe-covering price list. Asbestos cements are sold by weight, there being no standard list price. Asbestos felt is sold at discounts from the 1907 asbestos felt price list.

In 1920 the discount on asbestos air-cell pipe covering was 40 per cent until May, after which it stood at 35 to 40 per cent during the remainder of the year.

Discounts in 1920 on 85 per cent magnesia coverings ranged from 5 to 12½ per cent from "list" during the four months from February to May; from 5 to 15 per cent in June to October; and from 10 to 20 per cent from "list" in November and December.

Prices of asbestos cement in 1920 ranged from $1.75 to $3 a bag of 100 pounds.

TARIFF HISTORY.

Asbestos and composition pipe and coverings have never been specifically mentioned by name in any tariff act.

COMPETITIVE CONDITIONS.

Great Britain and Germany are the largest foreign producing countries of asbestos articles. These countries are not selling pipe and boiler coverings in the American market to any considerable extent, and severe competition from Great Britain and Germany with the domestic product in this country is not expected. Manufacturers in the United States are largely dependent upon foreign sources for supplies of raw asbestos. However, Great Britain is entirely dependent on imports of this mineral and the deposits in Germany are not sufficient to supply the needs of German manufacturers.

America's foreign supply comes mainly from Canada and the rest from Rhodesia and South Africa. Nearly all the Canadian production is consumed in the United States; in 1918, more than 95 per cent of the total Canadian production was sold here. Great Britain having no asbestos deposits in the British Isles, imports practically

all this raw material from Rhodesia and South Africa; Germany also receives its foreign supplies from these sources.

Rhodesian and South African asbestos are known for their long fiber, and are used chiefly in the manufacture of spun asbestos articles, whereas the greater part of Canadian asbestos is of short fiber, not suited for spinning. Long asbestos fiber finds little use in the manufacture of pipe and boiler coverings because of its greater cost. For that reason Canadian asbestos is mostly employed in the production of these articles. Blue asbestos (crocidolite) is also somewhat used, particularly in England.

Freight on asbestos raw material from Canada to Great Britain and Germany, plus freight on the finished product, practically prevents much sale of pipe and boiler coverings in the United States from these countries.

In European countries there is considerable use of an asbestos covering which resembles rope. This is wrapped around pipes. Formed coverings, which are more cheaply applied and at least equally efficient, are almost exclusively used in the United States.

ASBESTOS SHINGLES, SLATES, WOOD, OR LUMBER.

General Information.

TARIFF PARAGRAPH, ACT OF 1913.

PAR. 367. Manufactures of * * *, asbestos, * * *, or of which these substances or any of them is the component material of chief value, not specially provided for in this section, 10 per cent ad valorem.

DESCRIPTION.

Asbestos shingles, slate, wood, or lumber are made from short asbestos fiber mixed with hydraulic cement, the asbestos forming about 15 per cent of the product by weight. These products are known for their extreme durability and fire-resisting qualities. The shingles are of various shapes and colors, made in sizes from 4 by 8 inches to 16 by 16 inches and in different thicknesses. The kind in most common use is 8 inches wide, 16 inches long, and $\frac{1}{8}$ inch thick. Heavier shingles, tapered shingles with rough texture surface, and colored shingles are made chiefly for artistic effect or to imitate slate.

Uses.—Asbestos shingles and slate are suitable for use wherever roofing material is required or employed. Asbestos lumber is used largely in making fireproof walls, doors, and partitions; as a fire stop in floors; in electrical work to safeguard against fires from electric wires; for deflectors, division plates, and barriers where an electric arc is liable to form; for lining controllers, flue boxes, and various safety devices; in electric flatirons and other electric heating devices.

Substitutes.—Asbestos roofing in sheets and rolls, tin; sheet iron; galvanized iron; corrugated iron, and numerous sheet roofings made from various compounds, and roofing materials claimed by the inventors to be fireproof are competing articles and substitutes for asbestos shingles. Metal sheets of various kinds are frequently used in place of asbestos wood or lumber.

DOMESTIC PRODUCTION.

In 1920 asbestos shingles, slates, wood, or lumber were manufactured in the United States by 14 concerns.

The amount and value of the total annual production are not known. The industry has grown rapidly in recent years, due to a wider knowledge of the products and to the increase in the number of their uses since their first introduction into the United States in 1907.

Raw materials.—The materials employed are hydraulic cement and asbestos fiber, in proportions of about 85 per cent cement and 15 per cent asbestos. Cement is made in large quantities, from domestic materials, in this country; comparatively small quantities are annually imported. The asbestos employed is mostly imported from Canada,

only comparatively small quantities of domestic origin being obtainable. Both these articles enter the United States free of duty.

Equipment.—Machines in use are largely automatic. Only a small amount of hand labor is required to produce the finished article. Labor is chiefly employed to handle the raw materials and finished products.

In this industry there is practically the same use of machinery in foreign countries as in the United States.

Methods of production.—Two distinct processes for making asbestos shingles—one American, the other Austrian—are now in use. In both high compression is necessary.

American method.—In the American process the shingles are rolled. The mixed dry material—asbestos fibers and cement—is automatically fed from a hopper to a traveling belt, evenly distributed and combed out before passing between rolls. The machine is automatic. Its operation, for example, when finished slabs of fiber concrete three-sixteenths of an inch thick are desired is as follows: The hopper gate is adjusted and the picker rolls arranged so that the feed of material and the combing and leveling operation of the picker rolls deliver a band or layer of material about three-fourths of an inch thick to the traveling belt. The pressure exerted by the rolls is so adjusted that a layer of material passing between the rolls is compacted, while still dry, to about one-half (three-eighths inch) its original depth. This compression gives the layer of material sufficient consistency to enable it to be projected across a slight gap to a belt on the "wet" part of the machine. After thus leaving the "dry" division of the machine, the layer of dry compressed material is supplied from a vibrating sprinkler pipe with water, which penetrates all parts of the layer before the material reaches a second set of pressure rolls. These pressure rolls in the "wet" division of the machine are so adjusted as to compress the wet layer of material to a thickness of three-sixteenths of an inch. Slabs or sheets of sizes desired for the finished shingles are automatically cut from the layer. The sheets of fiber concrete then are stacked up, with metal sheets between the layers, in presses to dry. The pressure applied is from 8,000 to 10,000 pounds to the square inch and firmly unites the composition.[1]

Austrian method.—The Austrian process makes use of a cardboard machine. The asbestos, which preferably is previously disintegrated in an edge mill, is subjected to treatment in a mixing machine until sufficiently broken up—that is, until the fibers are separated as much as possible. Then the required proportion of hydraulic cement is gradually added and the entire bulk mixed thoroughly. This mixture flows immediately into a vessel with a stirring device, where it is diluted with five to six times the quantity of water while being continuously agitated or stirred. From this vessel the thin paste is conveyed to the cardboard-making machine, to obtain a cardboard-like product. The thin paste is carried to and on an endless rotating porous fabric, through which the water of the thin paste or pulp flows off, leaving on the upper side the hydraulic cement intermixed with asbestos as a thin layer. This layer is then conducted to a roller, which removes the layer from the endless fabric and rolls it up. Thus

[1] From U. S. Letters Patent No. 979547, granted to Chas. L. Norton, Hudson, N. H., Dec. 27, 1910.

a sheet is formed composed of several superimposed layers, the number of layers corresponding to the number of rotations of the roller. As soon as the product has reached the desired thickness it is cut to size and pressed to shape.[2]

Geographical distribution.—According to Thomas's Register of Manufacturers, asbestos shingles, slates, wood, or lumber were manufactured in 1920 by 14 concerns—2 in New Hampshire, 1 in Massachusetts, 2 in New York, 2 in New Jersey, 1 in Rhode Island, 2 in Pennsylvania, 1 in Ohio, 2 in Illinois, and 1 in Wisconsin.

History of the industry.—The first invention for the manufacture of these articles was by Ludwig Haschek, an Austrian. The products were manufactured for a number of years in Europe before being made in the United States in 1904. In 1910 an American, Charles L. Norton, invented a process for making fibrous sheets of cement and asbestos.

Domestic production and consumption.—The amount and value of the total domestic output and consumption are not known. American manufacturing capacity is adequate to supply the domestic demand, and a shortage of the product is only possible through the failure to obtain sufficient supplies of asbestos, the bulk of which must be imported.

Domestic exports.—Statistics of imports of the articles mentioned in this survey are not separately compiled by United States customs officials, but are included with figures showing total exports of all kinds of asbestos manufactures.

FOREIGN PRODUCTION.

Canada is the principal foreign country selling asbestos shingles and asbestos lumber in the American market. The Canadian product, which is made by one factory, is equal in quality to the product manufactured in this country, but the Canadian industry is small.

IMPORTS.

Separate statistics of imports of asbestos shingles, slates, wood, or lumber are not compiled by the United States customs officials, and little is known, except that imports are not considerable, regarding the quantity annually received from foreign countries. It is probable that most, if not all, of these imported articles come from Canada, where only small quantities are produced.

PRICES.

In 1920 the catalogue prices of a popular brand of gray asbestos shingles, f. o. b. factory, ranged from $1.60 per hundred for 4 by 8 inch size to $11.50 per hundred for 16 by 16 inch size. Prices for veneered shingles were quoted from about 25 to 33⅓ per cent higher, and colored shingles from 56 to 66⅔ per cent higher than gray shingles. Asbestos building lumber was quoted from 15 cents a square foot for sheets one-eighth inch thick to $1.20 a foot for sheets 1 inch thick, with a liberal discount (not stated) on quantity lots.

[2] From U. S. Letters Patent No. 12594, granted to Ludwig Hatschek, Austria-Hungary, Jan. 15, 1907.

TARIFF HISTORY.

Asbestos shingles, slates, wood, or lumber have never been specifically mentioned in the tariff acts.

COMPETITIVE CONDITIONS.

The only competitor in the American market at this time is Canada, which country is well supplied with raw material, located just across our border. At present (1921) there is but one factory in Canada engaged in the manufacture of asbestos shingles and asbestos wood or lumber. This factory is controlled by American interests.

With available small supplies of domestic asbestos near at hand and large supplies in Canada, American manufacturers had a considerable advantage over European manufacturers, either in Great Britain or on the Continent, who must import their asbestos material. American manufacturers can obtain their material practically as cheaply as can the European producers, and in order to sell in the American market European manufacturers are required to meet the additional expense of transatlantic freight on the heavy finished product.

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this, industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Guy G. George and Joseph M. Donohoe, of the Commission's staff, and of others.

CATGUT, WHIP GUT, OR WORM GUT.

SUMMARY.

The term catgut is derived from kitgut, an old term for violin gut. Catgut is made almost invariably from the intestines of sheep, never from the intestines of cats.

The crudest form in which catgut is known to the trade is a manufactured string; that is, it is not fresh gut, dried gut, or salted gut, which are the only crude or unmanufactured forms of sheep gut, but it is a string made by twisting together strands of intestines which have been cleansed and otherwise treated.

Catgut has been imported almost wholly under the free list as unmanufactured catgut (par. 443), simply because the strings are imported in the crudest form in which catgut is known to the trade. Thus, tennis gut, unsterilized surgical gut, spinning gut, catgut rope, and catgut in bundles cut to certain lengths, but which require further treatment before being salable as strings for musical instruments, have been imported under the free list. These strings are not raw, dried, or salted gut strings, but are in reality manufactured gut strings.

The value of domestic products of the gut-string industry is not given in the census statistics. However, based upon the reports of individual manufacturers, the annual value of products of the industry may possibly reach a total of $2,000,000 or more at the present time. It is a comparatively new industry, having been developed mainly since 1912. The imports of manufactured catgut reached a total of $68,003 in 1915, the highest total since the year 1910; and the imports of unmanufactured catgut reached a total of $328,796 in 1919, the highest total since the year 1910. Chicago is the center of the industry in the United States.

The wholesale price of German music strings laid down in this country before the war was 60 to 80 cents a bundle, while the cheapest price of American music strings was about $1.25 to $1.50. The present American cost of manufacture of a bundle of strings is given as about $2.75.

The price of 1,000 feet of No. 2 surgical catgut before the war was $2.50 for both the American and imported. The present price for American surgical catgut is $14, while some German catgut is now (spring of 1920) being received at a contract price of $7.50.

One of the leading American manufacturers states that the labor cost represents about 55 per cent of the total and the material cost about 45 per cent of the total. The manufacturers assert that the cost of raw material has increased about 500 per cent and the cost of labor about 200 per cent since the beginning of the war. One manufacturer thinks that the German string maker has little or no advantage in the price of the raw material, but that the cost of labor is much less.

Foreign string makers purchased at least a part of their material in this country before the war. The Tariff Commission has recently been advised that a German string maker has contracted with one of the packers for practically their entire output of spinners, or narrow sheep casings, which he expects to have dried, sent to Germany, and after being manufactured returned to this country as violin and surgical gut. The price paid for this material is not known.

The American manufacturer is asking for: A revision of classification, to make all gut strings dutiable; a higher duty on all gut strings; a high duty on "oriental" tennis gut, which is not made from intestines, but from animal sinews, silk, and glue.

The manufacturer of surgical sutures desires a duty on prepared surgical sutures.

Summary table—Catgut.

Year.	Imports for consumption (free).[1]	Imports for consumption (dutiable).[2]	Amount of duty.
1910	$148,670	$11,797	$2,949
1911	153,835	4,096	1,024
1912	131,249	4,878	1,220

General Information.

1913 TARIFF PARAGRAPHS.

366. Manufactures of catgut, or whip gut, or worm gut, including strings for musical instruments; any of the foregoing or of which these substances or any of them is the component material of chief value, not specially provided for in this section, 20 per cent ad valorem.

443. Catgut, whip gut, or worm gut, unmanufactured, free.

DESCRIPTION AND USES.

The term "catgut" is applied to gut strings prepared from animal intestines, generally those of sheep, more rarely those of the horse, ass, and mule, but never those of the cat.

The intestines are first thoroughly cleaned and freed from fatty substances and then steeped in water for several days, after which the external membrane is scraped off with a blunt knife. The scraped intestines are steeped and scraped again, after which they are steeped for some time in an alkaline solution, and then drawn through a perforated brass thimble. They are next subjected to the antiseptic action of the fumes of burning sulphur. Finally they are sorted and made into strings or split into strands which are made into strings.

The strings are put to many uses. The highest quality strings are used as strings for musical instruments and for making surgical ligatures, used by surgeons in closing wounds. Catgut is also used for cloakmakers' cords, hatters' cords, the whip gut of commerce, and cords for tennis rackets. The Italian violin string is generally regarded as the best violin string obtainable, although the American string has been highly praised by leading violinists. American manufacturers supplied great quantities of surgical ligatures to the armies during the war.

Worm gut, or silkworm gut, is the fine strong fiber employed by anglers in attaching their hooks. It is obtained from the silkworms by taking them before they begin to spin and very carefully pulling them asunder. The glutinous silk contained in the silk glands is then drawn into a single thread and gently dried. Small quantities are imported annually from Italy.

"Oriental" gut, used in stringing the cheaper tennis rackets, is made from the sinews of animals, combined with silk and glue.

Surgical sutures might be defined as gut strings in their natural condition or tanned to render them more slowly absorbable in the body tissues, either sterilized, partly sterilized, or put up in glass tubes, jars, or containers, paper envelopes, or containers of tin foil, or other substances, ready to be subjected to sterilizing procedures to render them susceptible to use as surgical ligatures or sutures. The quality of this product determines its cost to a large extent, and the consumer would no doubt be interested in preventing a tendency to undersell this product with a cheaper imported article of poorer quality.

DOMESTIC PRODUCTION.

Machinery plays only a small part in the manufacture of gut strings, practically all work being done by hand labor. The supply of raw material, which is a by-product of the packing industry, is large. After cleaning and scraping, the intestines are split into strands, the smooth parts entering into the highest grade strings, while the rough parts, to which the supporting membrane of the intestines was attached, are used in making coarser and larger strings. The size of the string depends upon the size and number of strands twisted together. The strands are attached to a stationary point at one end and to a wheel at the other. Turning the wheel twists the strands together. This string then becomes the catgut of commerce.

There is not a great deal of information available as to the size and character of the organizations manufacturing gut strings, but it is obviously an industry which may be handled on a small scale as well as on a large scale. At least two of the large Chicago packers are engaged in the manufacture of gut strings for various uses. Other manufacturers buy catgut or surgical catgut, which is their raw material for the manufacture of surgical ligatures. The highest grade string is required for surgical ligatures and their manufacture requires special laboratories and highly trained men.

The manufacture of gut strings is a comparatively new industry in the United States. One of the largest manufacturers started his factory in 1912. It has been stated by several string makers that 80 to 90 per cent of the gut strings used in the United States before

the war were imported. The industry has grown rapidly since the beginning of the war, probably as a result of the greater demand for surgical ligatures. It should be noted that imports increased during this period, although the increase in price would indicate a smaller increase in volume than in value.

FOREIGN PRODUCTION.

Germany, England, Scotland, and Japan appear to be the principal countries exporting to the United States. European countries have the advantage of experienced labor in the manufacture of gut strings, and possibly the advantage of cheaper labor. The quality of the product of German, Italian, and Swiss manufacturers has generally been considered superior for many purposes to that of the American.

Competition from foreign string makers is feared by the American manufacturers. Before the war 80 to 90 per cent of the gut strings used in this country were made abroad. The Tariff Commission has recently been informed that a German string maker has contracted for practically the entire output of narrow sheep casings of one of the large packers, which he intends to have sent to Germany to be manufactured and then returned to this country as an imported article. This practice was common before the war, and if it is resumed it appears that the domestic manufacturer will have very active competition to meet.

IMPORTS.

The total importation of manufactures of catgut was $62,907 in 1914, which was a great deal higher than previous years, the total for 1913 being only $3,417. Germany and Japan furnished $50,000 of the 1914 importation.

Imports of unmanufactured catgut reached a total of $153,779 in 1911, but declined to $122,733 in 1914. In 1914 the principal nations exporting to the United States were Japan, Germany, England, Scotland, Spain, France, and Italy, in the order named.

Imports by countries are not stated separately after 1914. The average annual value of imports, excluding musical instrument strings, entered under the dutiable list, excepting the years 1914 and 1915, was less than $10,000. The value in 1914 was $62,399, and in 1915, $68,003. In 1919 and 1920 imports amounted to $14,446 and $8,041, respectively. Imports entered for consumption under the free list have increased since 1914, when the total was $123,551. In 1917 the total was $316,491, but declined somewhat in 1918, the total for the year being $216,810. In 1919 and 1920 imports amounted to $328,796 and $172,662, respectively.

Strings for musical instruments made of gut were first separately stated in 1914. In that year imports were valued at $76,778, the highest. Imports for the year 1920 were valued at $26,486.

PRICES.

The first known shipment of catgut from Germany since the war was received in April, 1920. The contract price agreed upon for this and subsequent regular shipments for a stated period in American dollars was $7.50 for 1,000 feet of No. 2 surgical catgut. The present

price of American catgut is $14. Before the war the American price was the same as the German, $2.50.

One of the principal American manufacturers states that their cheapest prewar price on music strings was $1.50 a bundle of 30 strings, while the German strings were laid down in this country at 60 cents to 80 cents a bundle. The present catalogue prices on American strings range from $3 up for a bundle of 30 strings, the different prices depending upon the length and quality of the strings.

TARIFF HISTORY.

Strings for musical instruments were not included in the paragraph with manufactures of catgut until the act of 1913. In 1894 a duty of 25 per cent ad valorem was imposed on strings for musical instruments. This was increased under the act of 1897 to 45 per cent ad valorem, and was retained at that rate in the act of 1909. The act of 1913 included strings for musical instruments with manufactures of catgut, and reduced the duty to 20 per cent ad valorem.

Manufactures of catgut, whip gut, or worm gut were made subject to a duty of 25 per cent ad valorem by the act of 1894, and remained at this rate until the act of 1913, which lowered it to 20 per cent ad valorem. Until the act of 1913 manufactures of catgut were subject to the same duty of 25 per cent ad valorem since the act of 1883.

The act of 1894 enumerated unmanufactured catgut, not further manufactured than in strings or cords, on the free list. They were also so enumerated by the act of 1890. In 1897 the qualifying clause was omitted, and "catgut, whip gut, or worm gut, unmanufactured," has remained in this form on the free list since that date.

COMPETITIVE CONDITIONS.[1]

Foreign production of gut strings is carried on to some extent by family labor, although factories are also maintained. Succeeding generations of families have made strings, and thus foreign labor has become highly skilled. Before the war foreign labor was also much cheaper than American labor, but no accurate information on foreign labor costs in this industry in 1920 is available.

Domestic labor costs are said to have increased from an average of 17½ cents an hour before the war to as high as 46⅔ cents an hour at the present time. Manufacturers represent that the cost of raw material has increased from as low as ½ cent per 8-yard length of sheep and lamb intestines to as high as 5½ cents per 8-yard length. One manufacturer states that the cost of making a bundle of violin strings has increased from $1.20 before the war to $2.75 at the present time.

The domestic industry is a comparatively new one and has developed principally since the beginning of the war. One manufacturer's factory space has been increased 600 per cent since the beginning of the war. Another states that the industry has increased at least fivefold since the war removed foreign competition.

Before the war 80 to 90 per cent of the gut strings used in this country was imported. The American manufacturer was undersold and the leading string makers anticipate destructive competition

[1] This discussion is based largely upon correspondence received by the Tariff Commission.

again in the very near future unless protected by a high duty. American producers assert that before the war German string makers were able to buy raw material in this country and after manufacturing it abroad return it as a manufactured article at a price which was less than the domestic cost of production. The Tariff Commission has been informed that a German string maker has recently contracted for the output of raw material of one of the large packers, which he will send to Germany to be manufactured and returned to this country.

TARIFF CONSIDERATIONS.

The American gut string makers are asking that the classification be changed, so that only fresh, dried, or salted intestines be allowed to enter under the free list, and so that all other strings made of gut, which they hold are manufactured strings, be made subject to duty.

"Oriental" gut, which is not manufactured in this country, but which is imported from Japan, is made of animal sinews, silk, and glue, and enters free of duty. It is used for stringing tennis rackets, but is used only on the cheaper rackets. The price of a coil of this string which is sufficient to string a racket is given as 30 to 35 cents. The manufacturer states that the cost of sufficient tennis gut to string a racket is about $1.20. The manufacturer is asking for a higher duty on "oriental" gut.

Surgical catgut now enters free of duty, since it is the raw material for surgical ligatures or sutures. Manufacturers of sutures say that the quality of imported catgut has been superior for their purposes, and that a duty on this material will have the effect of raising the price of their product to the hospitals and doctors without improving the quality. On the other hand, the manufacturers state that catgut may be imported as surgical catgut free of duty, and then be used as strings for musical instruments.

Surgical sutures are a manufactured product not now separately stated in the tariff act. The quality of the product largely determines its cost. While there is no evidence of imports of any consequence, it seems quite probable that sutures might be manufactured abroad as well as catgut at a lower cost than in this country. Perhaps the most dangerous element of competition would be the attempt to import a poorer quality of sutures at a cheap price and call them just as good as the American. This the consumer would certainly object to.

A reclassification which will draw a clear distinction between manufactured and unmanufactured gut strings seems to be desirable. A duty on "oriental" gut, as well as on all manufactured gut strings, would be in line with the policy of assessing duties on manufactured articles. Surgical sutures appear to deserve separate statement as a manufactured article.

Costs and prices.—According to the statements of two of the leading string makers, labor costs have increased about 200 to 250 per cent since the beginning of the war, or from 17½ cents to 46⅔ cents an hour in one case, and from 17 cents to 43½ cents in the other case; while raw material has increased in cost about 500 per cent, or from ½ cent to 6½ cents per 8-yard length of sheep intestines in one case, and from 1 cent to 5½ cents in the other case.

One of these manufacturers, however, states that the total manufacturing cost of a bundle of violin strings has increased from $1.20 to $2.75, which is an increase of only 129 per cent; while the other gives the increase as 95 cents to $2.87, which is an increase of about 200 per cent. The increase in the cost of manufacturing these strings has not been nearly so large in either case as the reported increase in the labor and material costs.

One of the manufacturers of surgical sutures states that the domestic price of catgut has increased six times since the beginning of the war, while another gives the increase of 1,000 feet No. 2 surgical catgut as 460 per cent, or from $2.50 to $14. In this case it appears that the increase in the price of the product has been greater than the increase of the principal costs entering into its manufacture.

The increase in the price of surgical catgut from Germany has been only from $2.50 to $7.50, or 200 per cent. (The present price of $7.50 in this case is not a conversion from marks, the goods being delivered in terms of dollars.)

One string maker, who is asking for a high duty, states that "we do not believe that German string manufacturers can secure raw material any cheaper than we can, but the labor situation is one on which we can not possibly compete * * *."

If the cost of raw material to the German maker has increased as much as to the American maker, and it is also freely admitted that German labor costs have advanced materially, it would hardly seem possible that there should exist such a wide difference in the present German and American price, based wholly upon the manufacturing costs.

Court and Treasury Decisions.

The terms "catgut" and "whip gut" are often used interchangeably. Whip gut or whipcord is the result of the process of the manufacture of gut into a twisted article. Colored catgut strings twisted and in lengths suitable to be used in stringing tennis rackets were held not dutiable as a manufacture of catgut, but free as unmanufactured. (United States *v.* American Express Co., 6 Ct. Cust. Appls., 36, of 1915.) Strands of gut twisted in the form of a rope or cable and then apparently coated with a light varnish like material are a manufacture of cutgut. (United States *v.* Sheldon & Co., 5 Ct. Cust. Appls., 421, of 1914.)

Colored cutgut strings in lengths suitable for use for stringing tennis rackets were held to come within this provision. The coloring was not a process occurring after the manufacture of the catgut, but pending the manufacture, and the colored article is not a manufacture of catgut. Whip gut or whipcord is the result of the process of the manufacture of catgut into a twisted article which clearly falls within this paragraph. The fact that whip gut, a result of such manufacture, is of a length suitable for use in the manufacture of tennis rackets was held not to remove it from this paragraph, since the record disclosed that this is the length in which whipcord so manufactured is produced in the first instance. (United States *v.* American Express Co., 6 Ct. Cust. Appls., 36, of 1915.) Catgut strings in lengths from 16 to 31 feet, used as material in making clocks and as belting on small lathes, also come within this paragraph rather than paragraph 161 as parts of clocks. (G. A. 8231, T. D. 37914, of 1919.)

Gut for surgical use, for tennis rackets, or for making fishing tackle or parts thereof, might be specified in the law.

MANUFACTURES OF AMBER, BLADDERS, OR WAX.

General Information.

1913 TARIFF PARAGRAPHS.

367. Manufactures of amber, * * * bladders or wax, or of which these substances or any of them is the component material of chief value, not specially provided for in this section, 10 per centum ad valorem; * * *.

419. Bladders, and all integuments, tendons, and intestines of animals and fish sounds, crude, dried, or salted for preservation only, and unmanufactured, not specially provided for in this section, free.

MANUFACTURES OF AMBER AND WAX.

Waxes are used chiefly for the manufacture of candles, floor waxes, and other polishes, insulating compounds, plastic masses, phonograph records, modeling wax, and pharmaceutical preparations.

Amber is used principally in ornaments, beads, pipes, cigar holders, and sometimes in scientific instruments as an insulating material.

Domestic production statistics are not available, as the various articles of which wax and amber are the component materials are shown as the products of their respective industries.

Imports of manufactures of wax averaged about $25,000 prior to 1918. In that year they were valued at $72,606, but declined to $14,994 in 1919. Exports increased from $47,303 in 1911 to $1,382,355 in 1919, and for the first six months of 1920 were valued at $875,000.

Imports of amber manufactures were valued at $9,333 in 1914; $721 in 1918; and at $6,757 for the first half of 1920.

BLADDERS.

Bladders of sheep, hogs, and cattle are dried after eliminating the fat, and used in foreign countries as containers for sausage, lard, and butter. The intestines and integuments are used for sausage casings and other coverings. The swimming bladders or sounds of fish provide isinglass.

Sausage casings are the only item of this classification on which domestic production statistics are available. In 1914 they were valued at $10,146,208, of which $9,077,593 (64,453,298 pounds) were produced as subsidiary products of the meat-packing industry, and $1,068,615 by establishments engaged primarily in their production.

Domestic exports of sausage casings in 1919 amounted to 25,477,028 pounds, with a value of $6,809,834. European countries were the largest markets, but they were exported to practically all parts of the world.

The imports of manufactures of bladders, except for the years 1917 and 1918, when they reached a value of $1,259 and $8,288, respectively, were negligible. In 1920 they were valued at $138.

Imports of bladders and all integuments, tendons, and intestines of animals (except fish sounds and sausage casings), unmanufactured, averaged, from 1908 to 1918, $138,060, reaching their highest value ($497,000) in 1918. In 1920 this declined to $251,423.

Fish sounds, crude, dried or salted for preservation purposes only, were imported to the value of $104,654 in 1917, but declined to $28,365 in 1920. For the past three years these imports have been chiefly from Canada. In former years large quantities were imported from England and Venezuela.

Sausage casings are imported chiefly from Australia, China, New Zealand, and Argentina. Large quantities are also imported from Europe. In 1919 imports of 11,234,028 pounds were valued at $5,629,412, or approximately five-sixths the value of domestic exports of this article, although less than half the quantity.

Beef weasands were not stated separately in import statistics until 1916. They are now held dutiable as unenumerated unmanufactured articles under paragraph 385. The value of imports in 1920 was $120,019.

TARIFF HISTORY.

Manufactures of amber, bladders, or wax were dutiable at 25 per cent ad valorem under the tariff act of 1890. Under the acts of 1894, 1897, and 1909 they were dutiable at 25 per cent ad valorem, and this was reduced to 10 per cent ad valorem in the act of 1913. Under the act of 1883 amber beads and gum and manufactures of bladders were on the free list.

Unmanufactured bladders, integuments of animals, were first enumerated in the act of 1883, and fish sounds in the act of 1890. They were admitted free under these and all subsequent acts.

Imports by countries.

COURT AND TREASURY DECISIONS.

Small articles resembling in shape and color, but not in size, various fruits and vegetables, and designed for use only in waxing sewing thread, do not substantially simulate artificial fruits and are dutiable as manufactures of wax. (United States *v.* Duckerhoff, 4 Ct. Cust. Appls. 384, of 1913.)

Wax is not restricted in its meaning by lexicographers, by the courts, or by Congress to substances of animal origin only, but includes all substances of kindred nature derived from mineral or vegetable sources. Paraffin is wax within this paragraph. (United States *v.* Coccaro, 4 Ct. Cust. Appls. 506, of 1913.).

Candles of paraffin wax and cotton wick were held dutiable as manufactures in chief value of wax and not exempt from duty as petroleum products. (G. A. 8018; T. D. 36958, of 1917.) But a combination of waxes stearic acid specially prepared for use in the manufacture of phonographic records is not classable as a manufacture of wax, and is dutiable as an unenumerated manufactured article. (Abstract 28036; T. D. 32379, of 1912.)

Beef weasands are not free of duty under this paragraph as "integuments, tendons, and intestines of animals," but are dutiable as nonenumerated unmanufactured articles under paragraph 385. (United States *v.* White, 8 Ct. Cust. Appls. 115, of 1917.)

Pituitary glands taken from the brain pan of the calf and used in the manufacture of certain medicines are also not within the provisions of this paragraph. (Frankfeld *v.* United States, 7 Ct. Cust. Appls. 296, of 1916.)

Turtle skin or integument lying between the shell of the turtle and the ribs and backbone, used for the purpose of making green-turtle soup, only the integuments being used, was held free of duty under paragraph 51 of the act of 1909. (Abstract 32627; T. D. 33511, of 1913.)

Linings of hogs' stomachs, salted, are free of duty under this paragraph as intestines of animals. (Abstract 43143, of 1919.)

Fish sounds, which according to the testimony are dried and preserved only enough to stand shipping, otherwise not preserved, were held free of duty under this paragraph (Abstract 40051, of 1916), as were fish sounds cleaned and dried after having been split to facilitate the cleaning and drying (United States *v.* Brown, 10 Ct. Cust. Appls. ——; T. D. 38295, of 1920).

Fish sounds, split and dried, the splitting apparently done to perfect the drying process, were likewise classified. (Abstract 41785, of 1918.)

Fish sounds, split, washed, and dried in the sun, such splitting being part of the drying process, were held not to be "prepared fish sounds" within the meaning of that provision in paragraph 34, but free of duty under the provision in this paragraph for "fish sounds, crude, dried, or salted for preservation only, and unmanufactured." (G. A. 8276; T. D. 38088, of 1919.) An appeal is pending from this decision. (T. D. 38125, of 1919.)

GOLDBEATERS' MOLDS AND GOLDBEATERS' SKINS.

General Information.

1913 TARIFF PARAGRAPH.

496. "Goldbeaters' molds and goldbeaters' skins," free.

DESCRIPTION AND USES.

Goldbeaters' skin is the outer membrane of the caecum, or blind gut, of the ox, prepared for the goldbeater. The manufacture is an extremely offensive operation, as the intestines are subjected to partial putrefaction to facilitate the separating of the membranes for the cleaning, drying, and finishing processes. They are finished by treating with camphor or alum and coating with white of egg.

A goldbeater's mold consists of a collection of about 850 leaves of goldbeaters' skins, parchment, and vellum, between which flattened pieces of gold are placed to be hammered out to the finished thickness and size. The intestines of about 380 oxen are required to furnish the leaves of skin for one mold. The skins are each 3½ inches square.

Imports in 1914 were valued at $26,634, practically all from England and Germany; in 1918, $22,609; and in 1920. $41,086.

Goldbeaters' molds and skins have been free of duty in all tariff acts from 1883.

Imports by countries (fiscal years).

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this, industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act, reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and Index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and Index," the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Charles F. Yauch, of the Commission's staff, and of others.

HATS, BONNETS, OR HOODS OF FUR.

SUMMARY.

In 1914 there were 224 establishments, with a total capital of $39,401,429, engaged in the manufacture of fur-felt hats. The total number of wage earners was 21,318, and the value of the product, $37,349,744.

Hatter's fur is by far the most important material entering into the manufacture of fur-felt hats.

The domestic production greatly exceeds the imported article. The skins from which the fur is obtained are, however, imported.

Until 1846 the making of fur-felt hats was a hand trade entirely, since which time machines have gradually replaced handwork, so that to-day there are very few operations that machines can not successfully perform. The European countries have kept pace with the Americans in the use of the most modern and improved machinery. The inventions are due largely to American ingenuity, but it is said that England, Belgium, France, and other European countries have copied American tools, machinery, and methods. Some establishments make the hat from start to finish, some make nothing but hat bodies, while others do finishing only.

The industry is centered in a few eastern States—Pennsylvania, Connecticut, New Jersey, New York, and Massachusetts.

Both value and quantity of fur-felt hats produced in 1914 decreased from that of 1909, the decrease in value being 22 per cent. The census year 1914 covered a period of business depression among fur-felt hat manufacturers. The decline in the business was also attributed to the greater use of caps, cloth hats, and wool-felt hats.

Imports dropped off greatly during the war, but even before the war the quantity imported showed a tendency to decline. Imports decreased from 42,943 dozen in 1910 to 36,725 dozen in 1914. Imports for the year 1912, however, amounted to 55,312 dozen. Imports have not reached prewar figures, the imports for the fiscal year 1920 amounting to 18,115 dozen.

Austria, Belgium, France, Germany, Italy, and England are the principal countries from which hats are imported. Exports of fur-felt hats are not separately shown in official statistics, but with the exception of a well-known make. exports are small.

Prices of hats remained stable during the years 1913–1915, but began to advance in 1916, and at the end of 1918 had advanced about 75 per cent over 1913 prices. This was in marked contrast to hatter's fur, which had advanced approximately 360 per cent.

Style does not afford the protection to domestic producers that it formerly did, due in great measure to the independence of chain stores or hat specialists in originating styles, which formerly were in the hands of a few manufacturers. Caps, wool hats, and hats made of cloth are coming into greater use, as they are cheaper than fur-felt hats.

The labor costs in Europe have been lower than in the United States, due to the lower wages paid abroad and to the introduction of American machinery and methods. In recent years, however, the industry abroad has been so disorganized as to render direct comparisons impossible.

Hats, fur-felt—Summary table.

General Information.

1913 TARIFF PARAGRAPH.

354. Hats, bonnets, or hoods, for men's, women's, boys', or children's wear, trimmed or untrimmed, including bodies, hoods, plateaux, forms or shapes, for hats or bonnets, composed wholly or in chief value of fur of the rabbit, beaver, or other animals, 45 per cent ad valorem.

DESCRIPTION.

Although head covering in some form is in use throughout the civilized world, the hat as generally recognized is not the form in widest use. The fez, turban, or other headgear is worn by people in thickly populated parts of the world as part of their religious belief. The best felt hat is made of fur. In competition with fur-felt hats are caps, hats made of cloth, and wool-felt hats.

DOMESTIC PRODUCTION.

In 1914 there were 224 establishments engaged in the manufacture of fur-felt hats. The total number of wage earners was 21,318 and the value of the product, $37,349,744. In addition, fur-felt hats to the value of $476,499 were made in establishments engaged primarily in the manufacture of other products. There is some duplication in the value due to the inclusion with "hats, fur-felt," of the product of establishments which made nothing but hat bodies, in some instances under contract work on materials by other manufacturers, and of still others which did finishing only.

Materials.—The chief materials used in the production of fur-felt hats are hatters' fur, leather, bands and binding, satin, and wire. Materials used in shaping and finishing hats are shellac, alcohol, dyes, and chemicals.

By far the most important single material is hatters' fur. This consists of the soft underfur of the rabbit, hare, coney, nutria, or beaver removed from the skin and prepared for use in the manufacture of hats. In the finished hat it does not resemble fur as generally recognized. Through the processes of manufacture the fur loses its identity and becomes a fibrous substance. The fur of the beaver is rarely used now on account of its high price. Rabbit skins are used almost exclusively in the production of hatters' fur. There is no rabbit in this country whose fur is good for hat making except in the production of hats that do not have to be dyed or colored. Some hat manufacturers prepare the fur in their own establishments, but it is mostly purchased from factories engaged in that line of production or from importers. Before the war the finest fur came from Germany. It is generally imported in a cut condition, but sometimes on the skin, in which case it is known as fur skins carroted.

A number of factories in Connecticut produce hat bodies as a final product. These bodies become the material for finishers. In 1914 there were produced in Connecticut 267,178 dozen hat bodies valued at $1,741,885, or $6.52 per dozen. Of the total production in Connecticut only 90,745 dozens, valued at $540,939, were used as material in other factories located in that State, leaving about two-thirds of the rough bodies to be used by hat factories outside the State. The total felt bodies used as materials in 1914 amounted to 395,848 dozens valued at $2,453,503.

Shellac is used in stiffening hat bodies. It is a product of British India. There has not been found a satisfactory substitute. It is subject to sudden fluctuations in price.

Logwood dyes have been superseded by anilines and alizarines resulting in reducing the time consumed in dyeing, greater variations in color, and better control over results.

A comparison of the value of hatters' fur consumed in the United States with imports shows that the domestic production is far in excess of the imports, but the skins from which hatters' fur is produced originate abroad.

The amount of hatters' fur used in the fur-felt hat industry in 1909 was 8,645,576 pounds, valued at $9,278,922, or $1.07 per pound. Imports of furs not on the skin prepared for hatters' use, including fur skins carroted for the fiscal year ending June 30, 1909, amounted to $923,088 and for the year 1910 to $1,499,815. On the basis of these figures imports for 1909 were not quite 10 per cent and imports for 1910 a little over 16 per cent of the total value consumed in 1909. Hatters' fur used in 1914 amounted to 5,766,904 pounds, valued at $7,108,248, or $1.23 per pound. Imports for the fiscal year 1914 amounted to $607,254 and for the year 1915 to $352,705.

Percentages of imports for the fiscal years 1914 and 1915 based on consumption in 1914 were, respectively, 8.5 and 4.9. The value of imports is not strictly comparable with that of consumption, as the former is the actual market value or wholesale price at the time of exportation to the United States in the principal markets of the country whence exported. To the import value, therefore, should

64912—21—N-13——2

be added transportation, insurance, and other charges in connection with the shipment; also duties and importers' profit.

Equipment.—Until 1846 the making of hats was a hand trade entirely. The principal processes of manufacture are now performed by machinery, the inventions of Americans. Those of Thomas Blanchard, H. A. Wells, and John T. Waring are, with some modifications, the foundation of present-day machine production. England, Belgium, France, and other European countries have copied American tools, machinery, and methods. The invention of machines used in the manufacture of hats has not been confined to the United States. The machine method of pressing derby hats was in use in England before being introduced here.

Methods of production.—The manufacture of fur-felt hats is divided into what is known as front-shop and back-shop work. Back-shop work begins with the raw fur and continues through the processes of making the bodies and shaping them ready to be finished. Front-shop work consists of the finishing processes. Most of the largest establishments make the hat from start to finish. The larger number of shops, however, is engaged in performing only part of the processes of manufacture, some make nothing but hat bodies, often under contract work on materials furnished by other manufacturers, and others do finishing only. The making of hat bodies is carried on in factories, while finishing is often done on a small scale by retail stores. For a comparison of establishments engaged in the manufacture of hat bodies and those engaged in the finishing of hats, see page 21.

Mixing.—The first operation in the manufacture of fur-felt hats is the mixing of the fur. The different furs are placed in layers in a bin and thoroughly mixed. From the bin the fur is transferred to a mixer consisting of a box partly wire screened and containing toothed cylinders revolving at high speed.

Blowing.—Blowing carries forward the process of mixing and, in addition, cleans the fur by separating and removing dirt and other extraneous matter. The fur is kept constantly agitated in a current of air. The blower is divided into a number of sections, each section being complete in itself. It is important that the fur be thoroughly cleaned, as otherwise defects will be brought to light in subsequent operations. Formerly the fur was passed through a six-section machine, but now the sections number from 12 to 40.

Forming.—Clean fur from the blower is weighed out into boxes, each containing a sufficient quantity to make one hat. The fur is fed into a machine called a former, which consists of a perforated copper cone revolving on a shaft and inclosed in a chamber. An exhaust fan draws the fur about the cone and holds it there by suction. When the fur is properly distributed the cone wrapped with a piece of wet burlap is removed and dipped into warm water until thoroughly soaked. The fur is then removed from the cone in one mass. This is made possible by the felting of the fur, which begins when the cone is lowered into the vat of water. In felt fabrics the fibers are interwoven and interlocked in every possible way. It has a smooth surface, no designs or figures, and does not need to be cut "to match." It is not only possible but necessary to start the work in the general form of the completed article, as the shape can not be greatly altered after once the fibers are matted without destroying the fabric.

Hardening.—Hardening consists of several operations, the object of which is to promote felting, to add strength and durability to the fabric, and to reduce the mass to proper proportions. The fur cone is rolled and pressed first by hand and afterwards by machinery. The hardener sprinkles the fur cone with hot water from a brush and wraps it in a cloth and rolls it a few times. The body is opened up to prevent sticking together and examined for imperfections. In the sizing room the starter does nearly the same work as the hardener, but with less care, and the sizer does about the same work as the starter but in a more vigorous manner. Sizing is a hand operation in some factories and a machine operation in others. In machine sizing the work is divided into three stages, the fabric being manipulated by rolls which in each succeeding stage are operated at higher rates of speed. After being sized to proper height and thickness the hat bodies are pinned out.

Pinning out.—This is a machine operation. The machine consists of a revolving cone upon which the hat body is placed and a second cone pressed against the outer surface of the body. The water is thus squeezed out. The smaller cone also acts as an iron. By this operation the felt is made smoother, of a more uniform thickness and the body more exact in size. Whizzers or centrifugal extractors are used to dry the bodies.

Shaving.—Long, loose hairs are cut off by passing the hat body over a cone-shaped roller that brings the fabric in contact with rapidly revolving knives. The finer soft hats are returned to the sizers for further manipulation.

Dyeing.—Some colors are obtained more satisfactorily if applied after the bodies have been stiffened. As a rule, however, dyeing precedes the stiffening process. If strong colors are desired the bodies are placed in vats of large capacities and stirred mechanically by moving paddles. If delicate shades are desired only a few bodies can be placed in the vat at one time, for their submersion in the bath dye beyond the exact time would intensify the color; hence large quantities can not be handled at one time.

Stiffening.—Stiffening consists in applying a solution of shellac to the bodies. It is done either by hand or machine. In the hand process the body is dipped into the solution and an operator using a brush or a "jack," scrubs or rolls the gum into the felt. In the machine process the body is passed between rollers which together with a brush work the gum into the fabric. The machine can be so arranged that more stiffening can be applied to different parts as desired. The bodies are then placed in ovens, with apertures in the top, through which the vaporized alcohol passes. To remove the shellac from inner and outer surfaces, the bodies are dipped in an alkaline solution, after which they are scrubbed with brushes and washed in fresh water. This is also a machine operation. Stiffening of soft hats is confined to the brims and is a machine operation.

Stretching and blocking.—After stiffening, the bodies are passed through several operations to give them the first rough outlines of the finished article. Before being stretched they are dipped in hot water to soften the shellac. Tip stretching consists in forcing the felt between the rays of two metal stars. The same principle is involved in brim stretching but the stars are so arranged that only

that part of the fur cone which is to become the brim is stretch
These two operations are performed by machines. Wet blocking
done by hand in some establishments and by machines in others.
is claimed that hand blocking is superior to machine as the la
puts too much strain on the body. Whizzers are used to dry
bodies after they have been wet blocked. Back shop operations
here.

FINISHING PROCESSES.

The finishing processes are conducted in the "front shop." The
consist in shaping the body, removing protruding fur fibers, smoothing
the felt with irons and pads, and trimming with bands, binding
leathers, and linings. Soft hat finishing differs from that for st
hats.

Pouncing.—Soft hats are crown pounced, which consists of fitting
the hat over a block, attached to a revolving shaft and rubbing the
surface of the felt with a pad of pouncing paper to give it smoothness.
Crown pouncing is done by hand and by machine, though the hand
process is considered the better method. Brims are pounced by
machines.

Before pouncing stiff hats, they are machine pressed which gives
the crown the size and dimensions required. As in soft hats, the
crowns are generally pounced by hand, especially in the better grades
and the rims by machine. Owing to the greater amount of shellac
in a stiff hat the pouncer has to use greater care to avoid wearing
down the fur so as not to expose the shellac. The pouncing machine
was invented in 1853 by John T. Waring, an American.

Blocking.—Hats are dampened and then the blocker stretches the
crown over a wooden block of the exact shape of the finished hat
until it fits the block. The blocker irons the brim. The crown of
the hat is ironed by a machine, an ingenious machine invented by
Charles Reid, an American. The soft hat is again pounced, this time
with more care.

Rim trimming and shaping.—The rough edges of the rim are
trimmed by a cutting machine and the rim brought to the desired
width. The curl given to the rim is also done by means of a machine.
Brims of stiff hats are rounded as in soft hats. Instead of being
curled, they are "edged up;" that is, turned up along the extreme
edge. The brim is set by a process known as matricing, the iron
mold used being known as a matrix. Edges are hand planed before
binding. Wires are placed in that part of the brim "edged up" to
produce a spring. In finer grade hats wires are not used.

Trimming.—The bands, bindings, and leathers have much to do
with the general appearance of the hat and it is necessary that suitable
trimmings be used to conform to shape and color of the body. Sew-
ing machines are used largely in attaching the trimmings.

Organization.—The total capital of the 224 establishments engaged
in the manufacture of fur-felt hats amounted to $39,401,429 in 1914.
For the industry as a whole it takes a little over a year to make one
complete turnover of capital. The corporate form of ownership pre-
vails, there being 103 of the corporate, 94 of the individual, and 27 of
"other" forms of ownership. About 81 per cent of the total value of
products was produced in establishments owned by corporations.

In 1914 six establishments reported products valued at over $1,000,000. Their combined products amounted to $13,618,957, or 36.5 per cent of the total value. The following tables show size of establishments according to value of products and average number of wage earners:

Establishments grouped according to value of products.[1]

[1] Data from Abstract of the Census of Manufactures.

In 1914 there were 15,539, or 72.8 per cent, males employed, of whom 158 were under 16 years of age, and 5,779 females, of whom 19 were under 16. The lowest average number employed was in May, 19,791, and the maximum in October, 22,438. The per cent of wage earners employed in establishments where the prevailing hours of labor were less than 54 per week, was 40.6 in 1909 and 74.5 in 1914.

Geographical distribution.—It was claimed by manufacturers at the tariff hearings in 1913 that the fur-felt hat industry was not a sectional nor a New England one. According to the census returns, 1914, the industry is confined to a few Eastern States—Pennsylvania, Connecticut, New Jersey, New York, and Massachusetts. These States contained 175 establishments, or 78.1 per cent of the total number, and produced a product valued at $35,988,044, or 96.4 per cent of the total. The industry is also confined to a few cities in those States, namely, Philadelphia, Danbury, Newark, New York, and Orange. The value of fur-felt hats produced in these cities amounted to $28,619,498, or 59.8 per cent in 1909, and to $27,305.966, or 73.1 per cent in 1914.

History of the industry.—The manufacture of fur-felt hats in the United States dates back to early colonial days. Encouragement was given to manufacturers by legislative enactments. The Assembly of Virginia offered 10 pounds of tobacco for every good wool or fur hat made in the colony. A prize of 40 shillings was offered by Delaware for the neatest and best hat manufactured in the lower counties. Exportation of raccoon skins were prohibited by Virginia. By 1731 the industry had become of so much importance that English manufacturers petitioned Parliament to forbid the importation of hats produced in the American colonies. The committee reported that 10,000 beaver hats were made annually in New York and New England, and that there were 10 hatters in Boston, one making 40 hats a week. Carolina also had a flourishing industry and exported hats to the Spanish islands. Zadoc Benedict began the manufacture of hats in 1780 at Danbury, Conn. He employed two apprentices. New London County in Connecticut was also a center of the industry. The industry had become of importance in Pennsylvania as early as 1786. It is estimated that there were produced 54,000 fur hats and 160,000 wool hats annually and that there were 68 hatters in Philadelphia and vicinity and 247 hatters in other parts of the State.

The total number of fur hats reported as manufactured in 1810 amounted to 457,666, of which 45,369 were made in Pennsylvania; 142,645, valued at $415,167, in Massachusetts; 31,524, valued at $94,052, in New Jersey; and fur hats valued at $304,472 in Maryland.

Manufacturers assembled in convention in 1831 estimated the production of all kinds of hats and caps at $15,000,000 annually and that employment was given to 15,000 men and boys and 3,000 women. The census of 1840 reported the value of all kinds of hats and caps at $8,704,342. In 1850 the capital of establishments engaged in the manufacture of hats and caps amounted to $4,427,798 and in 1860 to $4,136,572. In the latter year 2,449,672 fur hats, 2,462,974 felt or soft hats and 6,191,482 wool hats were produced. It was not until 1900 that the manufacture of fur-felt hats was treated as a separate industry by the census.

Up to 1846 the manufacturing processes were almost entirely performed by hand. The first notable invention appears to be that of Henry Blynn, of Newark, N. J., who in 1835 invented a machine for stiffening hats. Other noteworthy inventions are those of Thomas Blanchard, John T. Waring, and H. A. Wells, who may be considered the pioneers in labor-saving inventions. The ironing machine use in ironing the crown of the hat was invented by Charles Reid. The modern machines are based on the principles of these original inventions.

Domestic production and consumption.—It was not until the census of 1900 that separate statistics of production were shown for the fur-felt hat industry. The value of products in 1904 increased 31.7 per cent compared with that of 1899, and 30.7 per cent in 1909 compared with that of 1904. A comparison of the value of products in 1914 with that of 1909 shows a decrease of 22 per cent. The decreases for the various States were: Massachusetts, 76.9 per cent; New York, 35 per cent; Pennsylvania, 15.2 per cent; New Jersey,

9.7 per cent; and Connecticut, 8.9 per cent. On page 157 of the Census of Manufactures 1914, Vol. II, it is stated:

The census year of 1914 covered a period of business depression among felt-hat manufactures. This industry is one of the first to feel the pinch of a financial stringency, due to the fact that when a man finds he must economize, the cost of headgear is often one of the first items to be reduced. Thus the general business depression of 1914 was reflected in the manufacture of fur-felt hats.

Aside from the general depression which the manufacturers of fur-felt hats shared in common with many manufacturers in other industries in 1914, there were two additional causes of lessened production which related only to this industry. One cause of this change was the substitution of the cheaper cloth caps, popularized in connection with the automobile, for men's fur-felt hats, and of velvet, satin, and other cloth hats for women's fur-felt hats. The value of the production of "hats and caps, other than straw, felt and wool," increased from $13,689,338 in 1909 to $18,593,221 in 1914, or by 35.8 per cent; and this rather large increase took place at a time when many of the industries showed decreases or only insignificant increases in 1914 as compared with 1909. Furthermore, the styles of fur-felt hats prevailing in 1914 also resulted in lessened production. The demand at that time for soft instead of stiff hats, with a resulting reduction in the number required; for, when the style runs largely to stiff hats, the consumer buys a new one more frequently than when soft hats are in fashion.

Manufacturers stated at tariff hearings in 1913 that business was not up to full capacity due partly to change in styles and partly to the demand for cloth caps and wool hats. It was claimed that their factories were running 75 per cent of full time and in some cases as low as 50 per cent.

In the table which follows, production and consumption of fur-felt hats in the United States are shown for the years 1899, 1904. 1909, and 1914.

Production and consumption of fur-felt hats and bodies in the United States.

Item.	1899	1904	1909	1914
Production:	*Dozen.*	*Dozen.*	*Dozen.*	*Dozen.*

Fur hats	$25,385,506	$34,314,234	$43,442,466	$33,603,531
Fur hat bodies	992,730	660,959	2,703,738	2,372,937
Other than in hat factories		333,441	806,601	476,499
Total hats and bodies	[2] 26,378,236	[2] 35,308,634	[2] 46,952,805	[2] 36,452,967
Imports for consumption	80,250	119,883	397,917	664,717
Total production and imports	26,458,486	35,428,517	47,350,722	37,117,684
Domestic exports	(1)	(1)	(1)	(1)
Consumption	26,458,486	35,428,517	47,350,722	37,117,684

[1] Not separately stated. Manufacturers have stated at tariff hearings that outside of one firm there are practically no exports.

[2] Excludes in 1899, $1,432,951; in 1904, $1,654,160; in 1909, $1,718,426: and in 1914, $1,373,276 value of all other products and work on materials for others.

Exports.—Domestic exports of fur-felt hats are not separately stated in official statistics. With the exception of one firm, which has a well-known trade-mark or name, exports are small. Felt hats and hat materials are separately stated in 1918 and 1919. Exports for these years amounted to $1,273,799 and $1,699,532, respectively.

FOREIGN PRODUCTION.

The chief foreign countries producing fur-felt hats which come in competition with the domestic product are, or were before the war, Austria-Hungary, England, France, Italy, Belgium, and Germany. The industry is centered at Denton and Stockport in England, and at Brussels in Belgium. Domestic manufacturers state that the foreign-made hat in most active competition with the American-made hat is that which comes from Italy.

IMPORTS.

Imports for consumption decreased from 42,943 dozen in 1910 to 36,725 dozens in 1914, although the value increased from $564,606 to $664,717, or from $13.14 to $18.10 per dozen. The year 1912, however, shows imports of 55,312 dozen, valued at $875,257, the highest in quantity and value for the five-year period preceding the war. In the five-year period 1915–1919 (fiscal years) the greatest amount imported was in 1917 when imports amounted to 30,063 dozen, valued at $497,626, and the lowest in 1919 when they amounted to 14,786 dozen, valued at $405,431. In the year 1920 imports amounted to 18,115 dozen, valued at $579,888. The value per dozen has advanced from $13.14 in 1910 to $32.01 in 1920.

Imports by countries were first separately stated in 1912. In this year 56,280 dozens, valued at $885,943, were imported. Based on quantity 18.5 per cent came from Austria-Hungary, 16.7 per cent from Belgium, 25.1 per cent from France, 7 per cent from Germany, 6.4 per cent from Italy, 26.2 per cent from England, and 0.1 per cent from all other countries. Imports from Austria-Hungary averaged $19.88 per dozen, the highest; from Belgium, $10.76 per dozen, the lowest. The averages per dozen for other countries were France, $18.73; Germany, $16.86; and Italy, $13.36.

Imports from only two countries increased in quantity in 1914 over 1912. Of the 35,751 dozens imported 38.2 per cent came from Austria-Hungary and 12.8 per cent from Italy. England furnished 17.3 per cent; France, 15.1 per cent; Belgium, 12.6 per cent; and Germany, 3.8 per cent. Imports from all countries except Belgium increased in value per dozen. Austria-Hungary with $22.28 per dozen was highest and Belgium with $9.63 per dozen was lowest. Imports from England increased in value from $13.37 to $18.29 per dozen; Italy from $13.36 to $14.16; Germany, $16.86 to $19.59; and France from $18.73 to $19.25.

Imports dropped off greatly during the war. In the years 1917–1919, inclusive, no imports were received from Austria-Hungary, Belgium, and Germany. Imports from Italy during this period as well as for the years 1918 and 1919 exceeded prewar figures, while those of France and England declined. About 75 per cent of the quantity imported in the years 1918 and 1919 came from Italy. The value per dozen of hats imported in 1919 from France averaged $37.09; England, $37.01; and Italy, $24.58.

PRICES.

The prices shown on page 25 of this report are taken from Bulletin No. 27, Prices of Hatter's Fur and Fur-Felt Hats, issued by the War Industries Board. With reference to the source of the quotations the board states:

The prices of hatter's fur were obtained from the American Hatter. For hat prices quotations were obtained from manufacturers, and those grades were selected which the different firms consulted considered standard.

The War Industries Board, with reference to the rise in prices, states:[1]

* * * the prices of hatter's fur, which had been reasonably stable for the years 1913, 1914, and 1915, rose at the end of 1918 approximately 360 per cent above the 1916 price, while the prices of the finished hats increased only 75 per cent. The shipping embargo, of course, had a material effect on the price of fur, but the contrast between raw and finished product is so striking that, coupled with the fact of the large stocks known to be on hand, it gives ground for the suspicion held by members of the War Trade Board familiar with the industry that the raw materials had been subject of considerable speculation or profiteering. On the contrary, the hat manufacturers did not make the prevailing high prices of hatter's fur an excuse for marking up the material they had in stock and making a corresponding increase in the price of their hats.

TARIFF HISTORY.

With the exception of the acts of 1897 and 1909, the duty imposed on the importation of fur-felt hats has been ad valorem. The rate under the act of 1883 was 30 per cent; act of 1890, 55 per cent; 1894, 40 per cent; and 1913, 45 per cent.

The acts of 1897 and 1909 imposed an ad valorem duty of 20 per cent and in addition a specific duty varying from $2 to $7 per dozen in 1897 and from $1.50 to $7 per dozen in 1909. The classification according to value in the 1909 act was brought in nearer agreement with the commercial divisions in hat prices, which, starting with $4.50, increase in arithmetical progression by $1.50 per dozen. The following table shows imports for consumption, duties, average per unit, and equivalent ad valorem rate in representative years under various tariff acts:

Items.	1896 (tariff act of 1894).	1905 (tariff act of 1897).	1912 (tariff act of 1909).	1914 (tariff act of 1913).

[e] 49 per cent from July 1 to Oct. 3, 1913, and 45 per cent from Oct. 4, 1913, to June 30, 1914.
[1] Price Bulletin No. 27, War Industries Board.

[illegible] CONDITIONS.

[illegible] protection to the domestic [illegible] were originated by four or [illegible] and merchants in placing their [illegible] manufacturers would stipulate that the hats be [illegible] with the styles brought out by these leaders. [illegible] would not be known until the opening [illegible] which these models would be displayed for the first time. [illegible] would immediately copy these models and begin the manufacture of hats in fulfillment of their orders. The [illegible] was not in a position to compete successfully with the domestic producers on account of the greater length of time it would take them to make deliveries.

Other changes in hat styles have brought about a change in this respect. They do not depend upon the leading hat manufacturers for their styles but originate their own. Their orders are placed either with the domestic or foreign producer with whom most satisfactory arrangements can be made.

Caps, wool hats, and hats made of cloth are coming into greater use and consequently have affected the output of fur-felt hats.

Labor. Wages before the war were lower in Europe than in the United States, which together with the introduction of American machinery and methods resulted in a lower labor cost abroad. In a brief filed by American manufacturers in 1913 it is stated that the labor cost on an English hat selling at $14.40 per dozen was $2.74 and on an American hat selling at $14.85 per dozen $7.23. The wages of labor in England were said to be 10 per day, and the same in France, where there are no unions and where boys and girls are employed. According to census reports on the industry in the United States [illegible] per cent in 1909 and 74.5 per cent in 1914 of the total [illegible] were employed in establishments where the prevailing [illegible] was less than $4 per week. The disorganization of [illegible] has rendered it impossible to secure trustworthy [illegible]

[illegible] hat manufac- [illegible] is nearer the [illegible] and [illegible]

Hats, fur-felt [1]*—Summary.*

[The manufacture of stiff and soft hats of fur felt is presented under this heading. The fur of the rabbit, the hare, and the coypu is the chief material. In some instances it is removed from the skin in the larger hat shops, but to what extent can not be determined from the returns. Much of the fur is bought from establishments doing nothing but cutting hatters' fur; they are classed under "hat and cap materials." A considerable quantity of cut fur is imported. While many concerns classed under "hats, fur-felt," make the hat from start to finish, others make nothing but the hat bodies, some of them doing work under contract on materials furnished by other manufacturers, and still others do finishing only. There is thus some duplication in the value of products. Separate statistics were first shown at the census of 1899. In 1879 and in 1889 fur-felt hats were included with "hats and caps, not including wool hats" and in 1869 with "hats and caps."]

	Number of establishments.	Wage earners (average).	Primary horsepower.	Capital.	Wages.	Cost of materials.	Value of products.	Value added by manufacture.

[1] Data from Census of Manufactures: 1914.

The statistics for the manufacture of hats are included under six classifications: "Hat and cap materials;" "hats and caps, other than felt, straw, and wool;" "hats, straw;" "hats, wool-felt;" "hats, fur-felt;" and as "trimmed hats, and hat frames," under "millinery and lace goods." The following statement summarizes the statistics for these six classifications and gives a total for all varieties of head coverings as far as it can be shown from census reports. The inclusion of hat and cap materials and of hat bodies and hats in the rough results in duplication, as these materials are included in the value of products of the establishments that produce the complete article.

Hats and caps,[1] 1914—Miscellaneous.

	Total.	Hats.			Hats and caps other than felt, straw, and wool.	Trimmed hats and hat frames.	Hat and cap materials.

Act of—	Par.	Tariff classification or description.	Rates of duty, specific and ad valorem.
1883	400	Bonnets, hats, and hoods for men, women, and children, composed of * * * other material, not specially enumerated or provided for in this act.	30 per cent ad valorem.
1890	451	Hats for men's, women's, and children's wear, composed of the fur of the rabbit, beaver, or other animals, or of which such fur is the component material of chief value, wholly or partially manufactured, including fur hat bodies.	55 per cent ad valorem.
1894	335	....do....	40 per cent ad valorem.
1897	432	Hats, bonnets, or hoods, for men's, women's, boys', or children's wear, trimmed or untrimmed, including bodies, hoods, plateaux, forms or shapes, for hats or bonnets, composed wholly or in chief value of fur of the rabbit, beaver, or other animals:	
		Valued at not more than $5 per dozen	$2 per dozen and 20 per cent ad valorem.
		Valued at more than $5 per dozen and not more than $10 per dozen.	$3 per dozen and 20 per cent ad valorem.
		Valued at more than $10 per dozen and not more than $20 per dozen.	$5 per dozen and 20 per cent ad valorem.
		Valued at more than $20 per dozen	$7 per dozen and 20 per cent ad valorem.
1909	446	Hats, bonnets, or hoods, for men's, women's, boys', or children's wear, trimmed or untrimmed, including bodies, hoods, plateaux, forms or shapes, for hats or bonnets, composed wholly or in chief value of fur of the rabbitt, beaver, or other animals:	
		Valued at not more than $4.50 per dozen	$1.50 per dozen and 20 per cent ad valorem.
		Valued at more than $4.50 per dozen and not more than $9 per dozen.	$3 per dozen and 20 per cent ad valorem.
		Valued at more than $9 per dozen and not more than $18 per dozen.	$5 per dozen and 20 per cent ad valorem.
		Valued at more than $18 per dozen	$7 per dozen and 20 per cent ad valorem.
1913	354	Hats, bonnets, or hoods, for men's, women's, boys', or children's wear, trimmed or untrimmed, including bodies, hoods, plateaux, forms or shapes, for hats or bonnets, composed wholly or in chief value of fur of the rabbit, beaver, or other animals.	45 per cent ad valorem.

COURT AND TREASURY DECISIONS.

In applying the provision in paragraph 432 of the act of 1897 for "hats, * * * trimmed * * * composed wholly or in chief value of fur," the composition of the hats was determined by reference to the whole hat, including the trimming, rather than by referring to the body of the hat alone, so that where hats, the bodies of which were fur, were so trimmed that the silk trimming was the component material of chief value, the hats were held dutiable under paragraph 390 of the silk schedule. (Rheims Co. *v.* United States, 160 Fed., 925, of 1908.)

A similar question arose under the acts of 1909 and 1913 upon hats of straw trimmed with silk, etc. The trimming of the hat was declared to be an entity in determining the classification. (United States *v.* Lord, 4 Ct. Cust. Appls., 322, of 1913; Aitken *v.* United States, 6 Ct. Cust. Appls., 232, of 1910.)

Rabbit-fur hoods used by automobilists are dutiable under paragraph 384 rather than as fur wearing apparel. (Abstract 32941, T. D. 33594, of 1913.) Caps of rabbit fur are not within paragraph 384, not being hats in either customs practice or common parlance. (G. A 4708, T. D. 22228, of 1900.)

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Joseph M. Donohoe, of the Commission's staff, and of others.

General Information.

1913 TARIFF PARAGRAPH.

PAR. 351. Human hair, raw, 10 per centum ad valorem; if cleaned or commercially known as drawn but not manufactured, 20 per centum ad valorem; manufactures of human hair, including nets and netting, or of which human hair is the component material of chief value, not specially provided for in this section, 35 per centum ad valorem.

DESCRIPTION AND USES.

Human hair, other than the natural growth of the wearers, has been worn through the centuries for the purpose of adornment and to conceal baldness. At the present time it is manufactured into various products, the most important being those used in the hair-dressing industry, such as wigs, switches, bangs, hair nets, etc. Wigs and transformations are used extensively by theatrical folk and by men for concealing baldness. Women generally are users of human hair, additional to the natural growth, in the arrangement of their coiffures, and in the use of nets for maintaining the shape of the coiffures. Human hair is also used in the making of hair trinkets, watch chains, bracelets, etc. This use is unimportant.

An important and recent development of the use of human hair, due to war conditions, is the making of hair press cloth for use in extracting oils from cotton seed, flaxseed, etc. The greater amount of raw hair is used for this purpose.

MATERIAL.

Human hair is known to the trade by four grades.

Selected first quality is strictly first-class hair, all of which has been cut from the head; first quality is a mixture of cut hair and combings, usually 50 per cent of each; second quality consists entirely of combings, properly rooted, either drawn from the head in the process of combing or obtained from the other grades of hair in the process of heckling or drawing. Oriental and Russian hair, which is coarse, heavy, and oily, is known as third quality. Rooting the hair is placing all the root ends together; drawing or heckling is sorting or arranging the hair according to length.

SOURCES.

The sources of raw material are continental Europe and the Orient, China now being the greatest source of supply.

Before using the coarse, heavy, oily hair from the Orient and Russia, it is necessary to dye or bleach it. It is used principally in the manufacture of fabrics and for the cheapest grades of wigs, curls, etc., and for hair nets.

The finer grades of hair come from the peasants of Norway, and the countries of central and southern Europe. The peasant families save the hair detached from the head in the process of combing and sell it to the buyers. Also, especially in southern France, it is customary for the peasant girls to sell the entire head of hair. The

hair obtained by cutting in this manner is the very best grade and is used for the highest and most expensive quality of wigs. Some hair is also obtained from the heads of convicts.

Jute is sometimes used as a substitute for human hair in making wigs for theatrical purposes. It has the appearance of hair when made in this manner, but has poor wearing qualities.

PROCESS.

The raw hair is washed, combed, drawn, or heckled, sorted into lengths, and then sterilized by boiling. This is slow and tedious hand work, and is done abroad by hand labor. If curls or waves are desired the hair is wrapped around small sticks of the desired size. It is then boiled, after which it is baked. The curl or wave remains after the stick is removed.

In making switches, the method in general use is to weave the hair (several strands at a time) on three strings, the hair being the weft and the strings the warp. When the required amount is woven the strings are pulled taut, wrapped around the root ends and tightly tied. Other articles are made with an elaboration of this method, additional strings being added to give the desired width for wigs, bangs, etc. For the highest class articles this weaving is done on special high-grade lace, the lace being held taut in a frame. This weaving on lace is called ventilation. It is practically all handwork, the simplest kind of a stand for holding the strings being used. The lace for ventilation is woven in France by hand and is very expensive.

DOMESTIC PRODUCTION.

The human-hair industry in the United States consists entirely of manufacturing human-hair products. No domestic hair is saved or collected for this purpose, all raw material being imported.

The value of articles of human hair manufactured in the United States in 1909 was $11,216,000, but this declined to $3,335,000 in 1914. This large decrease is attributed mainly to changes of style, which is considered the controlling factor in the industry. Figures for later production are not available, but from information furnished by the trade, the production of hair nets, wigs, etc., in the United States has decreased. Hair press cloth manufactures have increased, but, as stated, this is a recent development not included in the above figures.

ORGANIZATION.

In 1914 there were 205 establishments engaged in this industry, employing 1,193 wage earners, with a total capitalization of $2,543,000. The individual form of ownership predominated, there being 137 such establishments, employing 608 wage earners and producing articles to the value of $1,529,000. Of the remaining establishments 28 were corporate and 40 of other forms of ownership. The business may be conducted on a small scale, as 26 of the establishments employed no wage earners and 82 of them had a production of less than $5,000 per year. Forty establishments had production of more than $20,000 per year, while four exceeded $100,000.

No domestic exports are shown in official statistics.

64912—21—N-12——2

FOREIGN PRODUCTION.

Detailed figures are not available for the production of human-hair goods abroad, but it may be stated that most of the better qualities of toupees, switches, wigs, etc., are made in Europe. Hair nets were formerly made by the home workers in the central and southern countries of Europe, but during the war this industry shifted to China, which is now the greatest source of supply for this article.

IMPORTS.

Imports of human hair for consumption declined from $3,500,000 in 1910 to $500,000 in 1915, but since then have increased to $7,574,809 in 1920. Prior to 1919 the largest single item of import was raw hair, but in 1919 and 1920 the manufactured articles value much in excess of the unmanufactured hair. This excess is caused by the tremendous increase in the value of hair nets imported.

TARIFF HISTORY.

Under the tariff of 1883 raw and uncleaned hair paid a duty of 20 per cent ad valorem. In all subsequent acts until 1913 the product was admitted free. In 1913 a duty of 10 per cent ad valorem was imposed. Under the act of 1883 the cleaned and drawn hair, not manufactured, was dutiable at 30 per cent ad valorem. In all subsequent acts, including the present law, the duty has been 20 per cent ad valorem. The manufactures of human hair in all the tariff acts from 1883 to the present time, with the exception of the act of 1894, when the rate was 30 per cent, have paid a duty of 35 per cent.

COMPETITIVE CONDITIONS AND TARIFF CONSIDERATIONS.

No serious competitive or tariff problem is presented with regard to manufactures of hair or cleaned but unmanufactured hair. The principal item of manufactures of hair is "nets and netting." These are made principally by home work in China, and, while some higher priced nets are made in America, the viewpoint of the trade is that the cheaper nets could not economically be made here.

With regard to raw uncleaned hair a question arises, with respect to the recently developed hair press cloth industry, as to the duty of 10 per cent on raw hair in relation to the duty of 15 cents per square yard on hair press cloth (par. 353). Press cloth manufacturers have asked an increased duty on the press cloth, stating that the duty on raw hair is considerably higher with regard to the hair content than the 15 cents per square yard duty on the manufactured article. This contention is covered in more detail in the Tariff Information Survey on the Hair Press Cloth Industry.

[1] Establishments in this classification clean, bleach, curl, and otherwise prepare human hair, including that of Chinese and Japanese, mohair, and yak, horse, camel, and other hairs, and manufacture them into articles of adornment. The products include ornamental hair work, puffs, rats, refined yak hair, rolls, theatrical and other wigs, toupees, transformations, foundations, switches, fronts, braids, beards, bangs, turbans, and turban pads, waves, and wavy hair for switches and wigs. Prior to 1899 the returns included small local establishments, manufacturing chiefly to individual order. In addition to the products covered by the table, hair work to the value of $11,615 was reported for 1914 by establishments assigned to other industries, principally millinery and lace goods.

		Manufactures of human hair, including nets and nettings, or of which human hair is the component material of chief value, not specially provided for in this section.	35 per cent ad valorem.

Court and Treasury Decisions.

Human hair tops are not specifically provided for and are assessed with duty under paragraph 385 as a nonenumerated article manufactured in whole or in part. (T. D. 36200, of 1916.) Such merchandise assessed under paragraph 385 were claimed to be dutiable under paragraph 286 and the protest was overruled by the Board of General Appraisers without affirming the assessment. (Abstract 38842, of 1915.)

Human hair yarn is dutiable at 35 per cent as a manufacture of human hair under paragraph 351; human hair press cloth made from the yarn is dutiable at 15 cents per square yard under paragraph 353. The 15-cent rate is generally considerably less than the 10 per cent on raw human hair under paragraph 351.

Separate provision might be made for human hair tops.

HAIR, CURLED, SUITABLE FOR BEDS AND MATTRESSES.

[Par. 352, act of 1913.]

SUMMARY.

Hair, curled, suitable for beds and mattresses, is produced from both domestic and imported hair. Horse, cow, goat, and hog hair is used, horsehair being the best. It is also the chief raw material imported.

In 1914 there were 19 establishments engaged in this industry. They employed 1,212 wage earners, had a combined capital of $2,930,000, and total production of $3,658,000.

Imports are negligible, being valued at $6 in 1919 and $90 in 1920. Domestic export statistics are not available.

No tariff or competitive problems seem to be presented in this industry. Horsehair, the chief article of raw material imported, is on the free list.

GENERAL INFORMATION.

1913 TARIFF PARAGRAPH.

PAR. 352. Hair, curled, suitable for beds or mattresses, 10 per cent ad valorem.

DESCRIPTION AND USES.

Curled hair is the hair of animals, chiefly that from the manes tails, and fetlocks of horses, and tails of cattle, dyed black and curled for use in stuffing mattresses, sofas, cushions, and in other upholstery work. An extensive use of curled hair is in the upholstering of automobiles. Only the shorter hairs from the tails and manes of the horse and tails of cattle are curled, the longer lengths being used for manufacturing haircloth.

MATERIALS.

Horsehair is the best and most generally used. Most of it is imported, chiefly from Argentina, China, England, Canada, Russia, and Uruguay. The domestic hair used is procured from the packing houses and tanneries. After the raw hair is cleansed and sterilized by boiling, it is dyed. The curl is then imparted by tightly plaiting and baking the hair.

PRODUCTION.

In 1909 the value of domestic production was $5,130,000. In 1914, it was $3,658,000. This decline was due to decreased use and not increased imports. The value of production for later years is not available, but 20,719,741 pounds were produced in 1916, 22,033,651 pounds 1917, and 13,652,610 pounds in 1918.[1]

Statistics on foreign production are not available, but no serious competition is offered to the domestic industry, imports for the past seven years having averaged less than $50.

DOMESTIC EXPORTS.

Exports of curled hair are not separately stated in the statistics. They are included in manufactures of animal hair, which average between $300,000 and $400,000.

[1] Report Bureau of Markets, Department of Agriculture, Dec. 2, 1918.

ORGANIZATION.

In 1914 there were in the United States 19 establishments engaged primarily in the manufacture of curled hair. They employed 1,212 wage earners and had a combined capital of $2,930,000. Chicago, Philadelphia, and New York are the important centers of the industry.

SUBSTITUTES.

While curled hair is the best material for its various uses, it is also the most expensive. Substitutes are being used in mattress and upholstery work, those most frequently used being seaweed and sea moss, Spanish moss, Tampico, and coconut fiber.

TARIFF CONSIDERATIONS.

No tariff or competitive problems seem to arise in connection with this industry. Horsehair is the principal item of raw material imported, and this is admitted free under paragraph 503.

HAIRCLOTH.

[Known as "crinoline," "hair seating," and hair press cloth.]

SUMMARY.

Haircloth known as "crinoline" and "hair seating" are made from the long hair of the manes and tails of horses. Crinoline is a light haircloth, formerly much used in feminine apparel, but is now confined principally to the stiffening of hats and bonnets and in stiffening men's coats. Hair seating is a heavy cloth used in upholstery, much less now than formerly.

Imports of crinoline are negligible. Those of hair seating are not stated separately from hair press cloth. The industry is relatively unimportant, the total production of all haircloth for 1914 being $2,395,486. No tariff or competitive questions are involved.

Hair press cloth is a very heavy cloth made from spun hair, chiefly human hair from the Orient. To a small extent horsehair from South America is used for some makes of this cloth. It is used in connection with the expression of cottonseed, linseed, and other oils, and is important as an auxiliary to the oil-milling industry. The manufacture of this type of press cloth developed during the war, it having come into general use as a substitute for camel's-hair press cloth, which was formerly almost exclusively used, but which could not be supplied in sufficient quantities owing to the curtailment of the supply of raw material.

Official production figures are not available, but it is estimated from information furnished by the trade that the annual production is about 2,000,000 pounds, with a value of $1,800,000. Imports are combined with hair seating and in 1919 were valued at $164,560. Practically all of these, however, were press cloth.

The industry faces strong foreign competition. American manufacturers request a revision upward of the duty on the hair press cloth. They state that the present duty of 15 cents per square yard is only about one-fourth, as regards the hair content, of the duty they pay on the raw human hair.

Summary table.[1]

General Information.

1913 TARIFF PARAGRAPH.

Par. 353. Haircloth, known as crinoline cloth, 6 cents per square yard; haircloth, known as hair seating, and hair press cloth, 15 cents per square yard.

CRINOLINE AND HAIR SEATING.

Description and uses.—Haircloth is made from the long hair obtained from the mane and tail of horses. It is a very strong, durable material, not liable to fade, but on account of its open texture catches a great deal of dust. Crinoline cloth is the light haircloth formerly much used for stiffening feminine apparel, but now principally used in stiffening bonnets and hats and men's coats. Hair seating is heavy haircloth used in upholstery.

Raw materials.—The chief raw material used is horsehair. Other hair is used to a small extent. Imports of horsehair come chiefly from Argentina, Brazil, Uruguay, Canada, Russia, England, Italy, Germany, and Belgium. The domestic horsehair is obtained from tanneries, from dead animals, and is inferior to the imported horsehair.

Processes.—The raw hair is boiled to clean and sterilize it, then is dried by high-speed centrifugal action, then drawn or heckled, sorted into proper lengths. It is then soaked in water to make it supple, and dyed black, when it is ready for use. Formerly it was woven on hand looms (now by machinery), with a black linen warp, the hair being the weft. The weave is a kind of sateen, the weft or hair being flushed to the surface. It is woven with a raw edge on each side, no selvage being possible on account of the short length of the horse hair. After leaving the loom the cloth is hot rolled to give it a luster.

Haircloth is made in widths of from 16 to 30 inches.

Substitutes.—The most commonly used imitation or substitute is that made from black polished linen warp and weft.

Imports.—Imports of crinoline are negligible; those of hair seating are shown under press cloth below, together with statistics of domestic production.

HAIR PRESS CLOTH.

Description and uses.—Press cloth is entirely distinct from crinoline and hair seating, being a very heavy thick cloth used in the oil milling industry as a container in which the seed meats are wrapped while being subjected to heavy pressure to express the oils. At the present time two different styles of press cloth are used—camel's-hair press cloth (covered by pars. 288 and 422) and hair press cloth, included in the paragraph under consideration.

Under the latter paragraph is included all press cloths made of human or animal hair not specifically mentioned elsewhere. Practically all hair press cloth used is that made of human hair. A haircloth made of horsehair is used as a protective mat for some purposes in the oil mills, but its use is small and relatively unimportant, not being used for the general purposes of press cloth.

Human-hair press cloth is made from the heavy, coarse human hair from the Orient. The principal requirement for this cloth is strength and resistance to heat, as the seed meats are pressed immediately after cooking while extremely hot. Spun hair is used in weaving the cloth. It weighs 44 to 66 ounces to a yard 12 to 13½ inches wide, or 7 to 11 pounds to the square yard, the different weights being used for different conditions. In view of the weight of the cloth, it is sold by the pound rather than by the yard.

Development of industry.—The manufacture in the United States of press cloth from human hair is a recently developed industry, its origin and growth having been due to war conditions. Prior to the war practically all the press cloth used was made from camel's hair, but with the supply of raw material curtailed, camel's-hair cloth could not be made in sufficient quantities to meet the demands. A substitute was found in the Oriental human hair. It is not equal to the camel's-hair cloth in wearing qualities, but met the demands as a substitute and can now compete with the camel's-hair cloth on a lower price basis.

While the spinning of human hair for this purpose is new here, it had been established in European countries. The process of spinning human hair for press cloth is different from that for making the camel's-hair cloth.

The press cloth industry is important as auxiliary to oil milling, press cloth being required in the making of cottonseed, linseed, castor, and other oils.

ORGANIZATION AND DOMESTIC PRODUCTION.

In 1914 the census of manufactures showed domestic production of all hair cloth as $2,395,486, 15 out of a total of 19 establishments being located in Pennsylvania, the others in New York and Rhode Island. The production of hair press cloth developed since 1914.

According to estimates of the trade, the annual production of hair press cloth is between 1,700,000 pounds to 2,000,000 pounds, with a value of $1,600,000 to $1,800,000. The mills are located in South Carolina, Georgia, Louisiana, Texas, Massachusetts, New York, and

Pennsylvania. The capitalization is not known, but heavy investments were made during the war to speed up production. Some of these mills confine their production to human hair press cloth, while some manufacture both types of cloth. It was necessary, however, for all to install special spindles for spinning the hair, the process being different from that employed in making camel's hair cloth.

There are no exports of press cloth, the entire domestic production being consumed at home.

FOREIGN PRODUCTION AND IMPORTS.

Statistics on foreign production are not available, nor are import figures shown separately. Imports of hair seating and hair press cloth are combined, the total for 1919 being $164,560. In 1913 the imports were only $31,000, but in 1914 they jumped to $106,000, the larger part coming in after the 1913 tariff act became effective. There was a decline the following year, but the total increased to $122,000 in 1918 and $164,000 in 1919. The 1920 total, however, is smaller than any year since 1914. It is claimed by the manufacturers that practically all of these imports were hair press cloth. The increased imports were incidental to the increased demands for press cloth.

TARIFF HISTORY.

Under the act of 1883 crinoline cloth was dutiable at 30 per cent ad valorem and hair seating at 30 cents per square yard; under the act of 1890 the duties were, respectively, 8 cents and 30 cents per square yard, which the act of 1894 reduced to 6 cents and 20 cents per square yard. Hair press cloth was first specifically included in the act of 1897, that act making hair seating and hair press cloth dutiable at 20 cents per square yard and crinoline cloth at 10 cents per square yard. The act of 1909 retained the duty of 20 cents per square yard on hair seating and hair press cloth, but reduced that on crinoline to 8 cents per square yard.

Prior to the act of 1913 camel's-hair press cloth was not specifically mentioned in the tariff, it being dutiable under Schedule K. Under the act of 1913 hair of the camel was placed on the free list (par. 650); press cloth of camel hair is dutiable at 10 per cent ad valorem (par. 288); and camel's-hair press cloth imported expressly for oil-milling purposes and so marked, and meeting the requirements specified is admitted free (par. 422).

COMPETITIVE CONDITIONS.

Human-hair press cloth faces domestic competition from camel's hair press cloth. They are related industries, however, some plants being equipped to manufacture both kinds of cloth.

During the period between the adoption of the 1913 tariff act and the beginning of the war the imports from England and Germany of both kinds of press cloth were heavy, and indicated that those countries could make the cloth for less than the domestic manufacturers. This competition was not serious during the war, the making of camel's-hair press cloth in those countries having ceased entirely, but the imports of both cloths showed a considerable increase in 1919. The source of raw material for camel's-hair cloth is more

accessible to the European manufacturers, and, as Russian human hair is entirely similar to Chinese hair, the raw material for the human-hair press cloth would also probably be cheaper.

TARIFF CONSIDERATIONS.

Camel's-hair press cloth and the hair from which it is made are both on the free list. The present duty on hair press cloth (par. 353) of 15 cents per square yard is equivalent to 1½ cents to 2½ cents per pound on the hair content of the cloth, a square yard weighing from 6 to 11 pounds. Compared to this, the average duty per pound paid on raw Asiatic hair for the first half of 1920 was $5\frac{3}{10}$ cents per pound. The manufacturers state that the loss due to cleaning, sorting, and otherwise preparing the raw hair is about 20 per cent, which makes the total duty paid on the hair content of the domestic cloth three to four times as much as that paid on the hair content of the foreign-made cloth.

The customs revenue from hair seating and hair press cloth has averaged about $5,000 annually since 1914, while that from the raw uncleaned hair (the greater part of which is used in hair press cloth) averaged $50,000 between 1914 and 1919. In 1919 it was $136,000 and in 1920 it was $153,350.

The present act combines hair seating and hair press cloth. The hair press cloth now imported is entirely dissimilar and distinct from hair seating, is of varying weights, and is sold by the pound instead of by the yard. It would seem desirable to separate it from hair seating and make the unit of duty the same as the commercial unit; that is, the pound.

No tariff questions arise in connection with crinoline and hair seating.

[1] Haircloth was formerly used most extensively in upholstering, and its manufacture was included under "upholstering materials." Large quantities of it are now used in the manufacture of clothing, and for this reason it was given a separate classification in 1909. This textile is made by using a warp of cotton yarn and a weft of horsehair. Hair bristles, brush material, and curled hair were also reported, but the value of these has been included in the amounts reported as subsidiary products to the upholstering materials industry.

Free.

COURT AND TREASURY DECISIONS.

Press cloths composed of camel's hair for oil milling purposes are exempt from duty, while the yarn from which they are made is dutiable at 18 per cent ad valorem under paragraph 287.

The provision in paragraph 431 of the act of 1897 for hair press cloth was held not limited to fabrics composed of the same material (horsehair) as the other articles enumerated in said paragraph. (Caldwell *v.* United States, 141 Fed. 487.) But a different conclusion was reached in another case where camel's-hair press cloth was held dutiable as manufactures of wool rather than as hair press cloth under that act. (Oberle *v.* United States, 165 Fed. 53.)

Hair press cloth, in chief value of camel's hair, was held dutiable as press cloth composed of camel's hair under paragraph 288. (Abstract 38425, of 1915.) Camel's-hair press-cloth mats are dutiable as manufactures of wool under paragraph 288; and combination goat's-hair and camel's-hair mats as a nonenumerated manufactured article under paragraph 385 when goat hair is the element of chief value. (T. D. 34285, of 1914.)

Cattle-hair cloths, square in form, with flaps to fold over similar to envelopes, used for pressing herbs for medicinal purposes, classified as a manufacture of wool under paragraph 288 and claimed dutiable as hair press cloth or as a nonenumerated manufactured article, were found not to be hair press cloth or an article made from hair press cloth. (Abstract 40330, of 1916.)

Regulations governing the marking of press cloths are prescribed in T. D. 33929, of 1913.

General Information.

1913 TARIFF PARAGRAPH.

Par. 503. "Hair of horse, cattle, and other animals, cleaned or uncleaned, drawn or undrawn, but unmanufactured, not specially provided for in this section," free.

DESCRIPTION AND USES.

The long hair from the manes and tails of horses is used as a filling, usually with a cotton warp, in making haircloth, fish lines, straining cloths, and in violin bows. The short hair from horses' manes and tails and from the tails of cattle is curled and used for stuffing cushions and for other upholstery work. The hair of cattle and other animals is a tannery by-product and is used in felt for roofing and for covering steam pipes. It is used, mixed with wool waste or cotton, in making coarse yarns for carpets, horse blankets, and the cheapest grade of tweeds. Cattle hair is also used as binding for mortar and plaster.

PRODUCTION.

Domestic production statistics are not available. Most of the cattle hair used is produced at home, while a large part of the horsehair is imported.

IMPORTS.

The average annual importation of horsehair has been somewhat less than 4,000,000 pounds a year for the last few years, although the imports exceeded 6,000,000 pounds in each of the years 1916 and 1917. In 1918 imports of horsehair were 3,978,240 pounds, valued at $1,316,643. In 1918, two-thirds of our imports of horsehair came from Argentina; China was the source of next importance, while

Italy, England, Canada, Mexico, and Uruguay also sent us considerable amounts. The imports of cattle and other animal hair, with the exception of horsehair, decreased considerably during the war. In 1914 they amounted to 10,507,680 pounds, valued at $1,051,698, while in 1918, they amounted to 4,029,839 pounds, valued at $550,306. Canada is the principal source of these imports. A large quantity came from Germany before the war.

EXPORTS.

Exports of unmanufactured animal hair amount to something over $1,000,000 a year on the average, most of which goes to Great Britain. Exports of manufactures of animal hair amount on the average between $300,000 and $400,000, principally to Canada.

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this, industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act, reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and Index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and Index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Charles F. Yauch, of the Commission's staff, and of others.

FANS.

General Information.

1913 TARIFF PARAGRAPHS.

349. Fans of all kinds, except common palm-leaf fans, 50 per cent ad valorem.

480. Fans, common palm-leaf, plain and not ornamented or decorated in any manner, * * * free.

DESCRIPTION.

Fans are made in a variety of forms but in general are of two kinds: (*a*) Those which can be folded; and (*b*) those which are permanently expanded or fixed. Folding fans are sometimes made of thin slips of ivory, wood, papier-mâché, etc. They are, however, more commonly made of a continuous surface of paper, silk, or other material mounted on strips and can be folded easily in the manner of a plaiting. Folding fans had their origin in Japan. Fixed fans are made of feathers set side by side, leaves of palm trees, and paper or other material spread over a rigid frame.

DOMESTIC PRODUCTION.

Statistics of production in the United States are not available. Data relating to this industry are included with "Fancy articles not elsewhere specified" in the census classification of manufactures.

Materials.—The chief materials used in the manufacture of fan sticks are bamboo, wood, bone, mother-of-pearl, celluloid, galalith, tortoise shell, horn, and ivory. The mountings are made of paper, parchment, cotton, silk, leather, and feathers of the ostrich, goose, and other domestic birds. The mountings are sometimes decorated with lace, paintings, or spangles, or combinations of these.

The domestic manufacturers depend almost entirely on the importation of fan sticks, fabrics, laces, feathers, and spangles used in their industry. This is due partly to the scarcity of skilled stick makers, spanglers, and decorators, and partly to the cost of manufacture, which, according to fan manufacturers, is commercially prohibitive in this country. Such materials are imported from Japan, France, Austria, and Germany.

Domestic production, consumption, and exports.—No data are available. As previously stated, the Census Bureau does not report data separately for this industry, nor does the Bureau of Foreign and Domestic Commerce report separately the value of fans exported.

FOREIGN PRODUCTION.

The principal foreign countries producing fans are Japan, China, France, Austria, Germany, and Spain. With the exception of Japan, no data showing value of production are available.

JAPAN.

The industry in Japan is centered at Kyoto and Nagoya. Fans are made by hand and usually in private houses. There are two kinds of Japanese fans, the folding and flat. Folding fans have handles made of bamboo, wood, or bone, and are mounted with paper, parchment, cotton, or silk. Flat fans are made of wire or bamboo frames covered with silk or paper. The decorations are put on the paper or silk by hand or machine. The Statistical Report of the Department of Agriculture and Commerce, Japan, for the year 1918 shows that there were in that year 1,129 factories and workshops engaged in the manufacture of fans. The total number employed was 7,301, about evenly divided between males and females. The average number employed per factory was less than seven. The value of the product amounted to $1,614,000. A comparison of the returns for the year 1912 with those for 1918 shows the following increases: Number of factories, 16; employees, 358; and value of product, $474,000. (See p. 10.)

OTHER FOREIGN COUNTRIES.

The industry in France is centered at Paris and in Austria at Vienna. The handles or sticks of French fans are made of wood, bone, horn, mother-of-pearl, celluloid, galalith, tortoise shell, mounted with tops consisting of paper, parchment, leather, cotton, silk-tissue, lace, and feathers. Austrian, German, and Spanish fans are made on lines similar to the French. Vienna, however, has been an important center for the manufacture of feather fans, and was considered, before the war, the principal market for this class of fans.

China produces the common palm-leaf fan with natural handle and leaf; palm-leaf fans with artificial handles and with edges finished with cotton binding; fans made of strips of bamboo woven by hand; and others of a more expensive type. Fans coming under the first classification are admitted free of duty into the United States; the others are dutiable.

IMPORTS.

Fans, other than common palm leaf.—The value of fans, other than common palm leaf, imported into the United States for the five-year prewar period, 1910–1914, averaged $233,914. The average for the five-year period, 1915–1919, was $91,041. The imports for 1920 amounted to $199,950, being more than five-sixths of the prewar average. Imports before the war came from Japan, Austria, France, Germany, China, Hongkong, and Spain. Of the total imports, $320,102, in 1912, 36.5 per cent came from Japan, 26.9 per cent from Austria, 24.9 per cent from France, 5.9 per cent from Germany, and 2.7 per cent from China. In the year 1918 the percentages were: Japan, 70.7; France, 15; and China, 2.3. The increase in percentage of imports from Japan was not due to greater quantities imported

from that country but to the decrease in the total value of fans imported, there being no importations from Austria and Germany and only about one-fourth of the normal amount in value from France.

Palm-leaf fans.—The average importation of palm-leaf fans for the five-year period 1910–1914 was 763,084 dozens, valued at $61,251, or $0.08 per dozen. For the years 1915–1919, the average was 281,250 dozens, valued at $35,119, or $0.12 per dozen. In 1920 there were imported into the United States 373,668 dozens, valued at $99,828, or $0.267 per dozen.

Practically all of the palm-leaf fans imported into this country come from China. Some come from Hongkong and a few from Japan. In the year 1912, when imports amounted to 1,091,931 dozens, valued at $78,143, 84.1 per cent of the total quantity came from China, 15.6 per cent from Hongkong, and less than one-half of 1 per cent from Japan. In some of the other years, however, the imports from China both as to quantity and value have been well over 90 per cent.

TARIFF HISTORY.

Fans, other than common palm leaf.—The phrase "of whatever material composed" in the tariff act of 1883 was omitted in all subsequent tariff acts. With this exception and changes in the rate, the language has been identical. The tariff act of 1890 did not enumerate fans; 35 per cent ad valorem was imposed by the act of 1883; 40 per cent, act of 1894; and 50 per cent, acts of 1897, 1909, and 1913.

Palm-leaf fans.—Common palm-leaf fans in all tariff acts 1883–1913 have been placed in the free list. The acts of 1897, 1909, and 1913 restricted the free importation of common palm-leaf fans to "plain and not ornamented or decorated in any manner, and palm leaf in its natural state, not colored, dyed, or otherwise advanced or manufactured."

COMPETITIVE CONDITIONS.

Domestic manufacturers have been compelled to import practically all of the fabrics, laces, feathers, spangles, and fan sticks used in the production of fans, as there are no affiliated industries in this country producing such materials in sufficient quantities at reasonable prices.

The art of dressing and dyeing feathers in Europe is generally considered superior to that done in the United States. During the war, however, advancement was made in the art of dressing and dyeing feathers, which together with the availability of domestic celluloid fan sticks has enabled the domestic manufacturers to turn out a product in competition with the imported article, unless the latter is something exceptional as to dyeing and shading.

The better grades of fans are subject to change of fashion. Paris is acknowledged as the originator of designs and there has always been a strong demand in this country for French fans.

Fans of the type made in Japan and China, due largely to their decorations, can not be successfully produced here. Decorations are put on by hand in both Japan and China. The decorations on the Japanese fan reflect the work of an individual artist, while those on the Chinese fan are generally an exact copy of a design.

Imported palm-leaf fans with natural handle and leaf or with artificial handle and edges finished with cotton binding do not compete with domestic manufacture.

The export trade of domestic made fans is very limited, as the foreign producers have long had control of the market.

COURT AND TREASURY DECISIONS.

The proviso to paragraph 410 of the act of 1909 was construed to cover all articles composed of tissue paper and by providing that such articles shall pay no less rate of duty than that imposed upon the component material of chief value of which any such article is made, the classification of tissue-paper fans was fixed as proper under that paragraph. (United States *v.* Mason, 2 Ct. Cust. Appls., 236, of 1911.)

Common palm-leaf fans alone being excepted, the natural and legal inference is that paragraph 384 is intended to embrace all other fans (United States *v.* Harper, 2 Ct. Cust. Appls., 101, of 1911), among them embroidered fans in chief value of silk. Paragraph 384 is more specific than the provision in paragraph 358 for "articles * * * embroidered * * * by whatever name known." (United States *v.* Field, 7 Ct. Cust. Appls., 430, of 1917.)

Folding fans are dutiable under this provision. (Abstract 38896, of 1915, following Abstract 33232, T. D. 33668, of 1913.)

GUN WADS.

General Information.

1913 tariff paragraph.—350. Gun wads of all descriptions, 10 per cent ad valorem.

Description and uses.—Gun wads are disks used to hold in place powder or shot, and are made of felt, cardboard, or jute.

Imports.—Imports for the period 1908 to 1916 ranged from $507 in 1916 to $3,716 in 1914. No imports are shown for the years 1917 to 1920, inclusive.

Tariff history.—The acts of 1883 and 1890 imposed a duty of 35 per cent ad valorem; those of 1894 and 1913, 10 per cent ad valorem; and those of 1897 and 1909, 20 per cent ad valorem. The tariff description has remained unchanged in all of these acts.

INDURATED FIBER WARE AND MANUFACTURES OF PULP, N. S. P. F.

General Information.

1913 TARIFF PARAGRAPH.

355. Indurated fiber ware and manufactures of pulp, not specially provided for in this section, 25 per centum ad valorem.

DESCRIPTION AND USES.

Indurated fiber ware is wood pulp chemically treated and molded into pails, kegs, tubs, boxes, cuspidors, coolers, trunks, cases, etc. Other manufactures of pulp include composite board for car ceilings, bulkheads, and door panels for steamboats, vulcanized fiber and fiber specialties for motors and dynamos, insulators, skate wheels, washers, disks and bushings, railway signals, electric rail joints, noiseless rollers and gears, fiber sheets, and fiber rods and tubing. Manufactures of papier-mâché and of vulcanized rubber come within paragraph 369.

PRODUCTION.

In 1914 production was valued at $4,483,000. There were 24 establishments located chiefly in Delaware and New York. The total capital was $6,862,000, and the number of wage earners 1,654.

TARIFF HISTORY.

Indurated fiber ware and manufactures of pulp were first specifically provided for in the act of 1890. They were made dutiable at 35 per cent ad valorem, which was also the rate in the acts of 1897 and 1909. The act of 1894 imposed a duty of 30 per cent ad valorem and that of 1913, 25 per cent.

INTERPRETATION AND COMMENTS.

Papier-mâché, a manufacture of paper pulp, might be transferred to this paragraph from paragraph 369, and the word "other" inserted between "and" and "manufactures."

Pulp goods [1]*—Production in United States.*

[From Federal census.]

All other	9	415	1,819,000	217,000	616,000	1,372,000

[1] In this classification are included establishments engaged in the manufacture from wood pulp or paper chemically treated of such articles as pails, kegs and boxes, tubs, cuspidors, vases, measures, coolers, bases, trunks and cases, plates and dishes, jars, trays, etc. Composite board for car ceilings, bulkheads, and door panels for steamboats, vulcanized fiber and fiber specialties for motors and dynamos, automobile parts, insulators, skate wheels, washers, disks and bushings, railway signals, electric rail joints, noiseless rollers and gears, fiber sheets, and fiber rods and tubes were also reported. The manufacture of wood pulp itself, except so far as conducted by establishments making the finished products mentioned, and the manufacture of paper from wood pulp are not included. The statistics of pulp goods were first reported separately at the census of 1889. In addition to the products covered by the table, pulp goods to the value of $105,318 in 1914 and to the value of $52,231 in 1909 were reported by establishments engaged primarily in the manufacture of other products—paper and wood pulp, steam packing, and looking-glass and picture frames.

Fiber ware, indurated, and manufactures of pulp—Imports for consumption—Revenue.

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Charles F. Yauch, of the Commission's staff, and of others.

FURS AND FUR GOODS.

FURS AND MANUFACTURES OF FURS, EXCEPT FUR HATS, BONNETS, AND HOODS.

SUMMARY.

Production and consumption of raw furs and fur goods.—The United States is the leading country in the production, manufacture, and consumption of raw furs and fur goods. A fur merchant has stated in a letter to the commission that New York City manufactures more fur goods than London, Paris, Leipzig, Vienna, and Moscow combined. The amount in quantity or value of production of raw furs in the United States can be estimated only. The sales of raw furs in New York and St. Louis in 1919 amounted to about $35,000,000, which, however, includes the value of foreign furs consigned to these points for sale, but excludes quantities of domestic furs used locally. The amount is probably below rather than above the domestic production.

In 1914 the value of dressed furs and manufactures of furs amounted to $2,875,000 and $43,633,000, respectively, as against total imports of $5,099,000 and exports of $870,824. In 1916 it was estimated that $61,000,000 was a conservative estimate of the value of fur goods bought annually by the people of the United States. Revenue collections under the 10 per cent excise tax on articles made of furs amounted to over $15,000,000 for the fiscal year 1920.

Sources of supply of raw furs.—Pelts of animals used in the fur goods industry come from all parts of the world. The pelts most generally used are those of animals which inhabit cold countries. The chief foreign producing countries are Russia, Siberia, China, Australia, Canada, and parts of South America.

The principal fur markets are London, Leipzig, Paris, Petrograd, Moscow, and Irbit in Siberia. The United States, due largely to the war, has taken the lead in the distribution of furs. New York and St. Louis are now equal in importance to any fur markets of the world, and are important centers in the international trade in furs.

There is much substitution and imitation of the more expensive furs. Low-grade furs by skillful dyeing and dressing can be made to resemble the more expensive ones, so that only an expert in furs can detect the difference.

Organization.—The collection of furs lies principally with large companies. Dressing and dyeing of furs is generally conducted as a separate industry by establishments of rather small units. Of the 96 establishments in 1914 three had a product in excess of $100,000, their combined product amounting to $1,985,000, or about 38 per cent of the total. The total wage earners were 1,525.

In 1914 there were 1,322 establishments with a capital of $29,677,371 engaged in the manufacture of fur goods. Of the total

establishments, 1,235 had a combined product of $23,774,000, or nearly 55 per cent of the total. One establishment had a product in excess of $1,000,000. The total wage earners were 9,030.

Geographical distribution.—Both the dressed furs and fur goods industries are centered in Greater New York. In 1914 about 68 per cent of the value of dressed furs and about 66 per cent of the value of fur goods were produced in that city.

Domestic exports.—Raw furs before the war were exported principally to England, Germany, Canada, France, and Belgium. In the year 1913 domestic exports amounted to $17,465,000 and in 1920 to $30,137,000.

Exports of dressed furs and manufactures of furs increased in value from $615,441 in 1912 to $8,745,757 in 1920. Canada was the principal purchaser before the war and has continued to be a steady and large purchaser. England did not begin to figure prominently in the trade until 1915. France became a large importer in 1916, and in 1920 took $4,011,338, or 45.9 per cent of the total exports. The export trade in dressed furs and fur goods with Argentina amounted to only $195 in 1913 as against $436,857 in 1920.

Imports.—Statistics of imports of raw furs by countries show the fur markets rather than the countries of origin. The principal countries exporting raw furs to the United States were, before the war, Germany, England, Canada, Belgium, France, Russia, and Australia. Imports from China, Russia in Asia, Japan, and Argentina, which before the war were small, show big increases in the value of furs exported. The largest prewar imports of raw furs amounted to $17,339,000 in 1912. The total value in 1920 amounted to $103,772,000. Part of this enormous increase is due to the rise in the price of furs, the growing importance of New York and St. Louis as world markets, and the increased demand in the United States for furs of all kinds.

Dressed furs on the skin came principally from Germany, France, Belgium, and England. They averaged somewhat over $5,000,000 before 1914. In 1920 they amounted to $6,529,000.

Importation of manufactures of furs compared with production in the United States are relatively small. France, Germany, China, and England were the principal suppliers before the war. In 1912 imports amounted to $2,301,000 and in 1920 to $4,913,000.

Plates and mats of dog and goat skins are imported principally from China and are used in the manufacture of the cheaper fur coats. The importation of wearing apparel made of fur is small. In 1913 the value was $392,000. The tariff act of 1913 divided wearing apparel into two groups: (1) Composed of or in chief value of hides or skins of cattle, dog, or goat, and (2) composed of or in chief value of fur, n. s. p. f. The highest importation under the first group was in 1918, when they amounted to $19,575. In 1920 the value of such articles imported amounted to $1,447. Under the second group the highest amount was reached in 1914, $344,507. In 1920 the amount was $94,240. Hatters' fur showed a tendency to decline in value until 1920, when imports amounted to 398,286 pounds, valued at $1,565,000, the highest in value for the period 1907–1920.

Competitive conditions.—Raw furs are imported free of duty into all countries except Russia. This international free trade may be attributed to the fact that the raw furs of one country are not com-

petitive with those of another country. Even furs of the same specie of animals vary greatly according to the region where obtained, and for this reason it may be said they are not competitive with each other. Fashion governs very largely the kinds of furs used without regard to the country of origin. The real competition lies in the marketing of the furs.

Foreign competition is felt in the dressing and dyeing of furs. It has been generally recognized in the past that Europeans excel in the art of dressing and dyeing furs. England owes her prominence in this branch of the fur industry to the peculiar property of the water and to secret processes and methods. It was not until 1913 that the United States Government sent the sealskins, collected on Pribilof Islands, to St. Louis to be dressed, dyed, and sold. They were formerly sent to London for that purpose. Germany also had a strong hold on the dressing and dyeing of furs, and the establishments at Leipzig engaged in this branch of the fur industry were noted for the excellence of their work. The French influence on the trade is primarily one of style and combination of colors. Previous to the war the best sealine and seal-dyed rabbit skins came from Germany, France, and Belgium. The war gave a great impetus to the industry in the United States, and it is now claimed that American dyers and dressers can produce furs which are unrivalled in color, sheen, suppleness, strength, and beauty.

American fur dressers and dyers have stated at tariff hearings that they have found it impossible to compete with the cheap foreign labor, especially that employed on the poorer grade of furs. Producers of hatters' furs have stated that labor cost in Europe is from 45 to 52 per cent less than in the United States, that substantially all chemicals and dyes used in their trade are cheaper abroad, and that they have been able to maintain the advantage over the foreigner only through quick deliveries and the granting of liberal lines of credit.

SUMMARY TABLE.

Furs and manufactures of furs, except fur hats, bonnets, and hoods.[1]

Fiscal year.	Imports for consumption.			Domestic exports.	Amount of duty.	Equivalent ad valorem rate on dutiable imports.
	Raw furs (free).	Dressed furs and manufactures of furs (dutiable).	Total.			
						Per cent.
1910	$15,591,336	$9,865,034	$25,456,670	$14,501,635	$2,336,966	23.69
1911	15,334,375	7,464,787	22,799,162	10,473,517	1,800,896	24.13
1912	17,404,721	7,359,945	24,764,666	14,975,449	1,677,452	22.79
1913	16,768,679	6,988,677	23,757,356	18,389,586	1,645,315	23.54
1914	11,521,374	5,098,711	16,620,085	14,969,371	1,284,720	25.20
1915	7,768,921	2,253,057	10,021,978	3,794,459	601,378	26.69
1916	16,875,685	2,883,786	19,759,471	9,288,786	751,816	26.07
1917	21,547,323	4,004,554	25,552,377	15,729,160	947,003	23.65
1918	35,627,633	1,938,166	37,565,799	13,903,631	402,332	20.76
1919	37,959,971	2,129,236	40,089,207	14,612,015	379,347	17.81
1920	103,764,703	8,620,685	112,385,388	38,883,097	2,104,877	24.42

[1] "Dressed furs" to the value of $2,875,036 and "fur goods" to the value of $43,632,693 were produced in the United States in 1914.

General Information.

1913 TARIFF PARAGRAPHS.

Paragraph 348. Furs dressed on the skin, not advanced further than dyeing, 30 per centum ad valorem; plates and mats of dog and goat skins, 10 per centum ad valorem; manufactures of furs, further advanced than dressing and dyeing, when prepared for use as material, joined or sewed together, including plates, linings, and crosses, except plates and mats of dog and goat skins, and articles manufactured from fur not specially provided for in this section, 40 per centum ad valorem; articles of wearing apparel of every description partly or wholly manufactured, composed of or of which hides or skins of cattle of the bovine species, or of the dog or goat, are the component material of chief value, 15 per centum ad valorem; articles of wearing apparel of every description partly or wholly manufactured, composed of or of which fur is the component material of chief value, not specially provided for in this section, 50 per centum ad valorem; furs not on the skin, prepared for hatters' use, including fur skins carroted, 15 per centum ad valorem.

Paragraph 491. Furs and fur skins, undressed, free.

Paragraph 603. Skins of hares, rabbits, dogs, goats, and sheep, undressed, free.

DESCRIPTION.

This survey is not confined to a specific article, but covers all articles coming under the fur industry, with the exception as noted in the title. These articles may be divided into three groups: (1) Furs and fur skins, undressed; (2) furs and fur skins, dressed or prepared in some manner for further use in manufacture; and (3) manufactures of furs.

The first group includes simply the skins which have been removed from fur-bearing animals. They are spoken of in the trade as pelts. The second group includes furs dressed on the skins, plates, and mats of dog and goat skins, manufactures of furs prepared for use as materials, and hatters' fur. The third group includes wearing apparel and other completed articles made of fur.

All of the articles coming under the second group, however, do not carry the same rate of duty, the rates varying according to the stage of manufacture and to the class of material of which the articles are composed. The same is true of articles in the third group.

The Bureau of the Census in the Census of Manufactures gives separate data for two groups only, namely: (*a*) Furs, dressed; and (*b*) fur goods. The former covers data for establishments engaged primarily in the preparation of fur skins, including scraping, currying and tanning, and bleaching and dyeing. Hatters' fur, dressed hair, and bristles are also reported in this group. The fur-goods industry covers data for establishments engaged in the manufacture of fur sets and furs, including boas, capes, collars and collarettes, muffs, stoles, fur coats and cloaks, fur and fur-lined overcoats, fur hats, caps, gloves, and mittens, and various minor products as bands, rugs, tippets, heads, tails, and paws. In some instances establishments engaged primarily in the manufacture of fur goods dress and tan skins, thus overlapping with the dressed-furs industry.

Plates and mats are trade names for certain standard sizes of furs. They are not separate skins, but consist of two or more skins joined or sewed together to bring them up to the standard of measurement and for convenience in transportation.

Crosses and linings are pieces of furs sewn together and made up into the form of crosses, squares, or linings.

Hatters' fur consists of the soft underfur of the rabbit, hare, nutria, or beaver when removed from the skins and prepared for use in the manufacture of fur-felt hats. Fur skins carroted are skins which have been treated with a solution of nitric acid and quicksilver to protect them from damage by insects and to facilitate the succeeding operations of manufacture.

Hatters' fur in the finished hat does not resemble furs as generally recognized. Through the processes of manufacture the fur loses its identity and becomes a fibrous substance.

DOMESTIC PRODUCTION.

GROUPS OR DIVISIONS.

Raw furs.—Statistics of production are unobtainable. The importance of the annual production of domestic furs is apparent from the sales held in New York and St. Louis, which in 1919 amounted to about $35,000,000. This figure includes many foreign furs, but it does not include large quantities of domestic furs which are used locally, and is probably below rather than above the domestic production.

Dressed furs.—Fur dressing and dyeing is the intermediate process between securing the pelts and manufacturing them into garments and other articles. It is usually conducted as an independent industry. In 1914 there were 96 establishments employing on the average 1,525 wage earners and turning out a product valued at $2,875,036. In addition products valued at $8,850 were reported by establishments assigned to other industries.

Fur goods.—In 1914 there were 1,322 establishments engaged in the manufacture of fur goods. The average number of wage earners amounted to 9,030 and the value of the product to $43,632,693. In addition products valued at $813,550 were reported by establishments engaged primarily in the manufacture of men's and women's clothing, millinery and lace goods, leather gloves, mittens, and horse furnishings.

Fur for hatters' use.—There are no separate data for this branch of the fur industry. The value of the product is included by the census with that reported for "Furs, dressed," or "Hat and cap materials."

MATERIALS.

Raw furs.—Raw furs form the material for the fur-dressing industry, and the dressed furs in turn become the material of the fur-goods industry. The domestic pelts most commonly used in making wearing apparel and other manufactures of fur are muskrat, skunk, opossum, and raccoon. Other domestic pelts of which large quantities are used are fox, wild cat, lynx, otter, beaver, badger, mink, and civet cat, a species allied to the skunk. In addition to these the census lists the following as the principal kinds of fur skins used in

the fur-goods industry: Bear, caracal, coney, ermine, hare, marmot, marten, rabbit, Chinese weasel, rat, nutria, sable, seal (Alaska and hair), squirrel, angora and Chinese goat, Bulgarian, Chinese, and Persian lamb, calf, dog, horse, kangaroo, kid, Russian pony, sheep, and wolf.

Chief sources of supply.—Pelts of animals used in the fur-goods industry come from all parts of the world. The pelts most generally used are those of animals which inhabit cold countries. Countries in the Tropics, however, are not devoid of animals whose pelts are in demand.

Russia, Siberia, China, Australia, Canada, United States, and South America are the chief countries from which raw furs are obtained. Chinchilla and nutria are practically the only furs which come from South America.

Russia and Siberia export pelts of the hare, rabbit, otter, beaver, bear, sable, sheep, goat, wolf, fox, lynx, squirrel, badger, ermine, fitch, kolinsky, marten, mink, and marmot. Canada produces bear, beaver, fox, lynk, marten, mink, muskrat, otter, and seal. Australia furnishes pelts of the hare, rabbit, kangaroo, opossum, wallaby, and wombat. China is the chief source of supply of dog, goat, and sheep skins. In China dogs are raised for the value of their skins. The skins are generally sewed together and are known as plates and mats.

Adequacy of supply.—The number of pelts of the smaller fur-bearing animals which is brought to the markets annually is very great. The advance of civilization upon the domains of these animals seems to increase rather than diminish their number. Among the smaller fur-bearing animals in the United States which seem to be increasing in number may be mentioned the muskrat, skunk, mink, fox, mole, weasel, and raccoon. The large fur-bearing animals, however, are decreasing in number.

Domestication and breeding of fur bearing animals.—The demand for furs is ever increasing, which, together with the scarcity of some kinds of furs, has led to the domestication and breeding of fur-bearing animals on a commercial scale in Canada, Russia, Germany, and the United States. Fur farming or ranching has been extended to the raising of foxes, beavers, martens, minks, muskrats, fishers, raccoons, sables, otters, and skunks.

The raising of rabbits and hares on the Continent of Europe is an industry of long standing. The French and Belgians raise many rabbits which have a good fur. This fur when dyed and dressed is put on the market in large quantities, but generally under another name.

In Canada the raising of black and silver foxes for their skins is now on a commercial footing, although admittedly a highly speculative business. Domestication of the black fox began about 1888 on Prince Edward Island and that of the silver fox about 30 years ago. Mink, raccoon, fisher, beaver, and muskrat are also found on Canadian fur farms.

In the United States, minks appear to have been the first of the wild fur-bearing animals to be raised for their fur. A resident of

Oneida County, N. Y., began to breed them shortly after the close of the Civil War. There are areas in the salt marshes of the Delaware and Chesapeake Bays where the muskrat is protected and the owners let out the "ratting" privileges. Fox farming has been conducted successfully in widely scattered localities. The breeders of skunks, however, outnumber the breeders of all other fur-bearing animals.

The species of rabbit from which hatters' fur is made are not indigenous to the United States, and it has not been possible to breed them and still retain the commercial characteristics of the fur.

With increased fur farming as a business and as a side line for farmers, together with the enactment of laws by the various States for the protection of fur-bearing animals, the prospects are fair for a future adequate supply of furs.

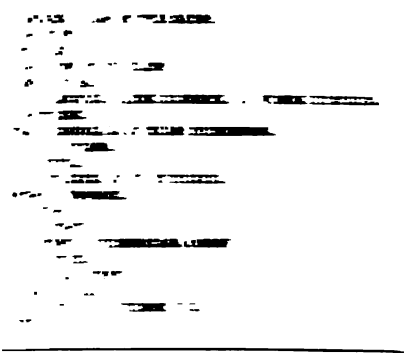
Substitution and imitation of furs.—Many furs are so finished and dyed as to retain little of their original appearance. By skillful dressing and dyeing, low-grade furs are made to resemble the more expensive ones. Skunk skins sent to England to be made up have come back as imported black marten or Alaska sable. The leopard skin is imitated; muskrats and marmots are striped like mink; martens, minks, and sables are darkened; raccoons, opossums, and white skunks are dyed black or natural skunk color; and silver foxes are successfully imitated.

The London Chamber of Commerce issued a list of the most common misdescriptions of manufactured furs. The list gives an excellent idea of the evil complained of and is as follows:[1]

American sable	Real Russian sable.
Fitch, dyed	Sable.
Goat, dyed	Bear.
Hare, dyed	Sable or fox.
Kid	Lamb or broadtail.
Marmot, dyed	Mink, sable, or skunk.
Mink, dyed	Sable.
Musquash, dyed	Mink or sable.
Musquash, pulled and dyed	Seal, electric seal, Red River seal, or Hudson seal.
Nutria, pulled and dyed	Do.
Nutria, pulled, natural	Beaver and otter.
Opossum, sheared and dyed	Beaver.
Otter, pulled and dyed	Seal.
Rabbit, dyed	Sable or French sable.
Rabbit, sheared and dyed	Seal, electric seal, Red River seal, Hudson seal, and seal musquash.
Rabbit, white	Ermine.
Rabbit, white, dyed	Chinchilla.
Wallaby, dyed	Skunk.
White hare	Fox and other similar names.
Dyed furs of all kinds	"Natural."
White hairs inserted in foxes and sables	Real or natural furs.

It is only fair to add that these more serious misdescriptions occur principally in advertisements appearing in the newspapers offering furs for sale at private addresses.

[1] Daily Consular and Trade Reports, 1911, p. 1028.



dealers in Canada and the
original, and natural
for consignment to

London or Leipzig. Canadian furs sold to New York merchants were often resold to merchants in Canada. Canada was also a large purchaser of raw European furs in the New York market. It was stated at the tariff hearings in 1913 that Canadian fur merchants purchased 50 per cent of their entire supply through United States merchants. It was also stated that raw furs brought into this country from China, Japan, and Australia are largely articles of international trade, most of them being reshipped to other countries in their raw state.

Classification of furs.—Furs are in many cases articles of luxury, and their use is subject to the whims of fashion and restricted to the rich. On the other hand there are many furs that serve as articles of general utility and provide a most effective apparel for resisting cold and inclement weather. It is impossible to draw with precision a line between furs as luxuries and furs as necessities. In response to inquiries from Congress for information along this line, the following classification was submitted to the chairman of the Committee on Finance of the United States Senate, by fur merchants of St. Paul, in a brief filed with the committee in 1913:[2]

Furs as articles of luxury.—Russian sable, marten, ermine, mole, lynx, black fox, silver fox, sea otter, fisher, fur seal, blue fox, white fox, chinchilla, polar bear, and grizzly bear.

Furs not made into articles of luxury, but are used by people of small means.—Marmot, hare and rabbit, wolf, raccoon, red fox, kitt fox, pony, house cat, wildcat, opossum, muskrat, Japanese mink, Chinese weasel, kangaroo, dog, goat, sheep and lamb, hair seal, wool seal, wombat, and wallaby.

Furs used by people of moderate means whenever prices are low, but which sometimes are fashionable and then are higher in price.—Squirrel, black and brown bear, badger, civet cat, beaver, holinksky, mink, fitch, nutria, skunk, wolverine, otter, and cross fox.

Manufacturers of fur may be divided into four groups: (1) Those producing the highest grade furs, (2) those producing medium grades for the better class of the dry goods trade, (3) those making a specialty of so-called popular-priced furs, and (4) those producing only low-grade coarse furs.

Equipment.

In the dressing and dyeing of skins the following apparatus is used: Washing tanks, drying vats, cleaning drums, polishing drums, wooden tanks for dyeing, revolving stone cylinders for beaming, and kicking machines for pounding the skins, and shearing and unhairing machines. Sewing machines, specially designed, form the principal equipment of the manufacturer of fur-wearing apparel.

The advent of the dehairing machine has done a great deal to change the fur-manufacturing business. By the use of this machine the long hairs of the outer coat of the seal, beaver, muskrat, mink, otter, and other fur animals can be removed, leaving only the soft under fur. German and American fur-sewing machines were introduced about 1890 and resulted in better work being done.

American furriers are generally considered leaders in ingenuity and latest methods of manipulating skins.

Methods of production.

The older method of dressing furs was to place the pelts in an alkali bath in order to soften them. The pelts were then tubbed,

[2] Tariff Hearings, Committee on Finance U. S. Senate, 63d Cong., 1st sess., Vol. III, p. 1590.

[illegible] large [illegible] product in excess of [illegible] aggregated [illegible] per cent of the total product. The number [illegible] establishments employing 50 or less was 841, or [illegible] per cent of the total. Eight establishments employed no [illegible] and one 546

[illegible] industry, comprises 1,322 establishments with an [illegible] capital of $81,077,371. Individual ownership also prevails in the [illegible] there being 711 individual, 143 corporate, and [illegible] partnership. There were 1,235 establishments [illegible] a product of less than $100,000, their aggregate product [illegible] to [illegible] or nearly 5.5 per cent of the total. One establishment had a product in excess of $1,000,000. Of the total

wage earners, 7,426, or 82.3 per cent, were in establishments employing 50 or less wage earners. One establishment, the largest, employed on the average 335 wage earners.

GEOGRAPHICAL DISTRIBUTION.

Both the dressed furs and the fur goods industries are centered in Greater New York. In 1914 about 68 per cent of the total value of dressed furs and about 66 per cent of the fur goods were produced in that city. Most of the establishments engaged in dressing furs are located in Brooklyn, and those engaged in the production of hatters' fur are located within a radius of 100 miles of New York City. Other centers of the dressed furs industry are located in New Jersey, Pennsylvania, Minnesota, Wisconsin, and Illinois. Other important centers in the fur-goods industry are St. Paul, Chicago, Detroit, Boston, Philadelphia, Minneapolis, Milwaukee, and San Francisco.

DOMESTIC PRODUCTION AND CONSUMPTION.

The United States is the leading country in the production, manufacture, and consumption of furs and fur goods. Statistics showing the number or value of raw furs collected are not obtainable. In 1919 the value of furs sold at St. Louis and New York was about $35,000,000, including, however, some imported furs, but excluding large quantities of domestic furs which were used locally. In the fiscal year 1919 imports of raw furs amounted to $38,000,000, domestic exports to $10,275,000 and reexports of foreign furs to $148,000.

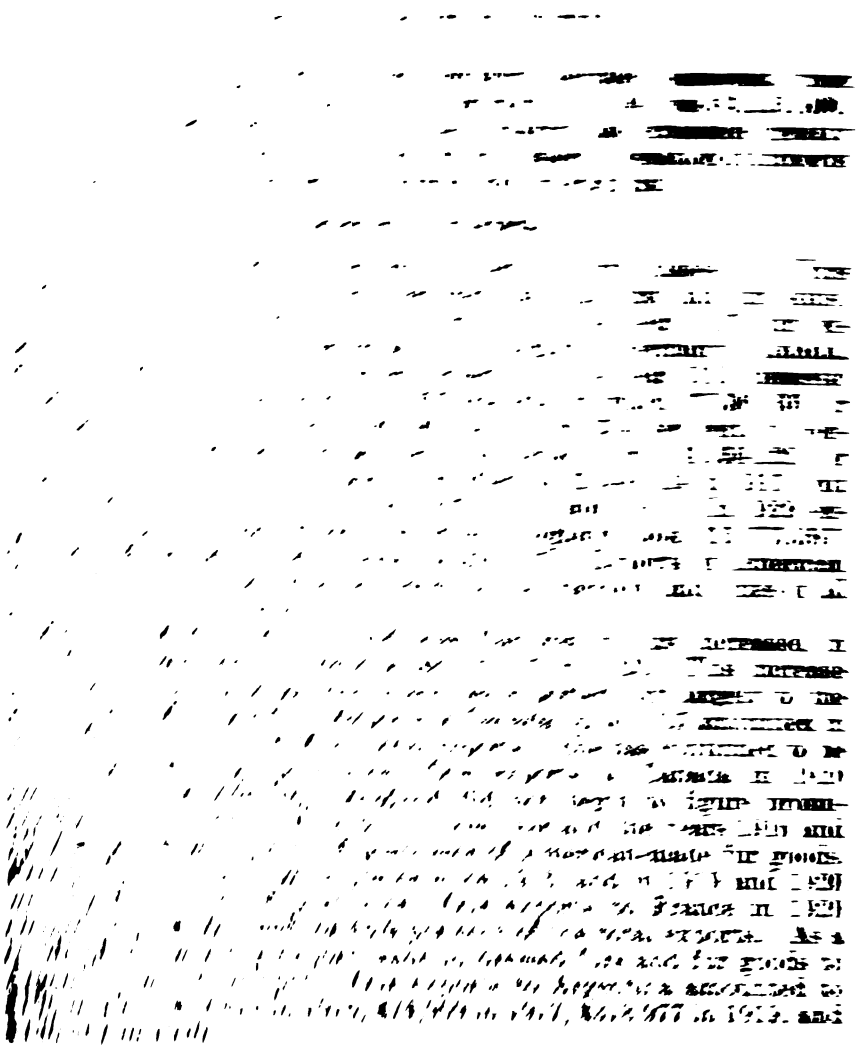
In 1914 there were imported into the United States dressed furs and manufactures of furs to the value of $5,099,000, as against production for that year of $2,875,000 in "furs, dressed," and $43,633,000 in "fur goods," and of domestic exports $870,824 for both "furs, dressed," and "manufactures of furs." Production data for 1919 are not yet available.

In an article on the fur trade of the United States appearing in Commerce Reports 1916, $61,000,000 was given as an estimate of the total value of manufactured furs annually bought by the people of the United States.

That the estimate for 1916 is far below the value of fur goods consumed by the people in the United States at the present time (1920) there can be no doubt. The revenue act of 1918 provided for an excise tax of 10 per cent on all articles made of fur on the hide or pelt or of which any such fur is the component material of chief value. A report of the Internal Revenue Bureau shows that the collections under the provision relating to furs for the fiscal year 1920 amounted to $15,300,000. It is stated by a fur merchant in a letter to the commission that "more fur goods are manufactured in New York than in London, Paris, Leipzig, Vienna, and Moscow combined."

The importation of raw and to a certain extent of dressed furs is due to the fact that a number of fur-bearing animals are not indigenous to the United States and must be imported if the demand is to be satisfied. It is in the dyeing and dressing of furs that foreign competition is felt. The importation of fur goods is small compared with the domestic production.

64912—21—N-10——3



Canada is about the only other foreign country which publishes statistics of production. In a preliminary report on the hat, cap, and fur industry for the calendar year 1918 the Dominion Bureau of Statistics states that the total capital investment amounted to $14,431,530, cost of materials at factory $8,438,424, and selling value of product at the factory $17,112,425. The following tables show the cost of the various materials used as well as the articles made and their selling value.

COST OF MATERIALS AND VALUE OF PRODUCTS.

The cost at the factory of the various materials used by Canada's hat, cap, and fur industry during 1918 was reported to the Dominion Bureau of Statistics as:

Materials used.	Cost value at factory.	Materials used.	Cost value at factory.
Furs and skins:		Trimmings, all kinds	$194,770
Raw	$1,774,470	Straw and straw plaits	440,644
Dressed	2,678,144	Thread, buttons, and fasteners	109,589
Woolen goods	1,030,747	Canvas, wadding, etc	44,826
Cotton and other goods	266,850	Leather for sweat bands	74,143
Silk and satin	477,573	Dyestuffs and chemicals	99,615
All other linings	205,881	All other materials	847,758
Muff beds and quilted linings	115,452		
Coat shells	78,012	Total	8,438,424

The selling value at the factory of the different articles made during the year was:

Articles made.	Selling value at factory.	Articles made.	Selling value at factory.
Men's coats:		Muffs	$1,172,430
Fur	$1,214,430	Stoles and other neckwear	1,452,988
Fur lined	261,231	Gloves and gauntlets, fur or fur lined	225,256
Women's coats and jackets:		Muff beds	101,499
Fur	3,632,695	Coat shells	4,100
Fur lined	329,267	Robes	283,224
Caps:		Straw hats and shapes	1,345,461
Fur	165,400	Velvet hats and shapes	809,086
Cloth	2,264,737	All other products	148,114
Uniform	402,763	Received for custom work and repairing	1,577,752
Hats:			
Fur	1,355,254	Total	17,112,425
Wool	384,658		

In a report on the hatters' fur industry in Belgium, Consul Naysmith, Ghent, states:

From January 1 to July 1, 1920, the total value of raw rabbit skins to the United States was 17,863,437 francs ($1,786,343), while the value of hatters' fur was 7,497,372 francs ($749,737). For 1919 the value of the exports of rabbit skins to the United States was $64,206 and of hatters' fur $15,323. Their combined value in 1913 was $1,590,438.

In a letter to the State Department, copy of which has been forwarded to the Tariff Commission by that department, the Belgian Embassy presents a representation, by the tanners and dyers of skin in Belgium, of conditions facing the Belgian rabbit-skin industry with relation to the American market.

It sets forth that prior to the war the United States furnished a market for approximately 50 per cent of their prepared rabbit skins, but that now (January, 1921), in view of the increased price of the

prepared skins and the consequent increase in the customs duty by reason of the ad valorem rate, the cost to the American importer is prohibitive. In detail, it is stated that formerly the prepared skins were offered in Belgium at 10 francs a dozen. The customs duty, at 30 per cent ad valorem, was 3 francs, or a cost (duty paid) to the American importer of 13 francs a dozen. Compared with this, the skins are now approximately 40 francs a dozen. This means a duty of 12 francs, or a total cost of 52 francs.

It is claimed that without the American market the industry can not survive, and the request is made that a new tariff classification provide for prepared rabbit skins at a rate of duty lower than that which now applies (Par. 348: Furs dressed on the skin).

The memorandum further sets forth:

> They respectfully beg to call attention to the fact that the American manufacturers find an almost open market for their goods in Belgium. A great many American furs, particularly those of an expensive nature, are imported from the United States into Belgium, and the customs duties applied to them is decidedly less than the customs duties applied to the rabbit skins, which is a cheap fur, when imported into the United States. The Belgium customs duty never exceeds, even for the most expensive furs, 0.90 franc per kilo. The following appears to be the consequence: While 5 skunk skins, weighing 1 kilo and valued at about 500 francs, are taxed by the Belgian customs officials only 0.90 franc, 12 rabbit skins, on the other hand, weighing 1 kilo also, but valued at 100 francs, are taxed by the American customs officials 30 francs: the Belgian manufacturers thus pay 30 francs duty on 100 francs, while the American manufacturers do not pay more than 1 franc (to be exact 0.90 franc) per 500 francs.
>
> The manufacturers entertain the opinion that the rabbit skin is not an article of luxury, and they take the liberty to set forth the request that, on that ground, it be reclassified so that a customs duty lower than the one which is imposed on the first be applied to it.
>
> Only if it be done can they find again in the United States a market for their goods, and without that market their industry is bound to fail.

IMPORTS.

Raw furs.—Statistics of imports of raw furs by countries show the fur markets rather than the countries of origin. Many of the raw furs imported from England and Germany are furs which have been sent there from other countries for sale in the London and Leipzig markets. General imports do not show the kind of skins imported from the various countries. Imports for consumption show the kinds of skins imported but not the countries from which imported. The principal kinds of fur skins imported, as shown in the imports for consumption, are beaver, hare and rabbit, fox, mink, marten, mole, muskrat, seal, and squirrel. Some of the important raw furs imported are muskrat, mink, marten, bear, fisher, fox, otter, seal, beaver, and wolf, from Canada; sable, ermine, kolinsky, seal, wolf, otter, and squirrel, from Russia; rabbit, kangaroo, opossum, wallaby, and wombat, from Australia; nutria and chinchilla, from South America. Undressed rabbit skins are also imported from France, Belgium, and Germany.

Our largest prewar imports of raw furs amounted to $17,339,198 in 1912. The value for the year 1913 was slightly less. In 1914 and 1915 the value of imports decreased about one-half but rose to prewar figures in 1916. Imports for the years 1918 and 1919 were more than double the prewar amount. The value of raw furs imported into the United States in 1920 amounted to $103,772,044, which is nearly six times that of 1912. This enormous increase in the value of raw furs imported may be attributed to the rise in the price of

furs, the growing importance of New York and St. Louis as world fur markets, the increased demand in the United States for furs of all kinds, improvement in the art of dressing and dyeing furs in the United States, and to the fact that the fur merchants and fur dressers and dyers of Europe are not functioning on a prewar basis.

The countries from which we imported the largest amounts of furs before the war were, in the order of importance, Germany, England, Canada, Belgium, France, Russia, and Australia. Imports from all countries, except Germany, Russia in Europe, and Belgium, increased greatly in 1920 as compared with those of 1912. Increases occurred in the value of imports from the following countries: France, England, Canada, and Australia. Countries—China, Russia in Asia, Japan, and Argentina—from which small quantities were imported before the war also show surprising increases in 1920 over 1912. The increases in the value of imports from these countries may be accounted for partially by higher prices, direct shipments to the United States instead of through the European fur markets, and in case of China and Japan, their being intermediate markets for collection of furs before final shipment to the United States. It is possible that the increased use of furs in the United States has caused a demand for furs which were formerly not in demand. This may also account partially for the increases in the value of imports from certain countries, but as no statistics are available which show the kinds of furs imported by countries, the extent of such trade can not be determined.

Dressed furs.—Imports of furs dressed on the skin which before 1914 were on the average somewhat over $5,000,000 a year decreased greatly after that date. In 1919 they reached their lowest point, $783,061. However, in 1920 imports had again reached prewar figures; in fact, had exceeded them. Imports for 1920 were valued at $6,528,733. Germany, France, Belgium, and England were the principal sources of imports before 1914. Imports from China formed about 31 per cent of the total in 1917 and over 50 per cent in 1918, but dropped in 1919 to less than prewar figures.

Manufactures of fur.—Imports of manufactures of furs came principally from France, Germany, China, and England before 1914. Of the total imports of $2,301,284 in 1912 $1,063,852, or 46.2 per cent, came from France; $569,227, or 24.7 per cent, from Germany; $191,647, or 8.3 per cent, from China; and $160,595, or 7 per cent, from England. In 1919 China sent $964,630, or 56.9 per cent; France, $325,058, or 19.2 per cent; England, $149,788, or 8.8 per cent; and Canada, $146,727, or 8.6 per cent. Total imports for 1920 amounted to $4,913,448, being more than double the prewar figures.

Imports for consumption show somewhat in detail the character of the goods described as manufactures of furs.

Plates and mats of dog and goat skins.—Imports of plates and mats of dog and goat skins have increased from $280,855 in 1914 to $1,029,852 in 1919. The number of such articles imported in 1919 amounted to 766,115, with an average value per unit of quantity of $1.34. These articles come principally from China and are used in the manufacture of the cheaper fur coats.

Manufactures of furs prepared for use as materials.—Included in this description are manufactures of furs further advanced than dressing and dyeing, plates and mats, except those of dog and goat skins, linings and crosses. Imports of such articles when made of

seal skin are small. In 1919 they amounted to $83. Other articles coming under this description have declined in value from $1,689,340 in 1910 to $50,265 in 1919.

Wearing apparel.—The tariff act of 1913 divided wearing apparel made of fur into two groups, (1) that composed of hides or skins of cattle, dog, or goat; (2) that composed of fur not specially provided for. Imports of the former were valued at $19,575 in 1918 and $85 in 1919. Imports in other years have been small. The value of imports under the second group reached the highest mark in 1914, $344,507. In two other years, 1917 and 1918, the value exceeded $100,000. In 1919 imports were valued at $13,599.

Hatters' fur.—This fur is used in the manufacture of fur-felt hats. In 1910 imports were valued at $1,499,815, the highest. In 1914 they amounted to $607,254, of which $108,052 were under the tariff act of 1909. Although there had not been a regular decrease in value of such furs imported, the tendency was toward a decline until 1920. These were imported 80,422 pounds, valued at $228,721, in 1919, and in 1920, 398,286 pounds, valued at $1,565,000.

PRICES.

Furs, like most other articles, have advanced to record heights within the last few years. The wholesale price of furs varies widely not only according to different species, but also to different grades of the same species. As an illustration of the wide range in prices, a fine silver fox skin sold for $1,000 in 1919 as against $150 to $200 for an average silver fox skin and $10 for a cheap red fox skin. It is stated that 25 fox skins of animals raised in captivity were sold in London in 1910 at an average of $1,400 each, and that the highest price paid for a single skin was $2,700. Top wholesale prices for raw furs in 1913 and 1920 are given for the following skins: Mink, $20 and $75; muskrat, $1 and $6.80; seal, $120 and $175; Australian rabbit, 90 cents and $4.20 per pound; beaver, $30 and $64; ermine, $5 and $4.75; blue fox, $100 and $270; red fox, $35 and $64; and moles, 50 cents and 70 cents.

Consul General Skinner, London, in writing on the fall fur sales in London, November, 1920, states:

> A general decline in prices has set in and, compared with the spring sale, the prices realized at the fall auctions declined by the following percentages: Ten per cent in Australian red fox, otter, northern mink, and northwestern wolf; 20 per cent in blue fox, white fox, Russian sable, squirrel skins; 25 per cent in Australian opossum, cross fox, ermine, stone marten, civet cat, black bear, and Persian lamb; 30 per cent in red fox; 35 per cent in lynx and musquash; 40 per cent in beaver, fisher, skunk, raccoon, fitch, white hare, marmot, gray and kitt fox, house cat, nutria and Tibet lambs and crosses; 50 per cent in wallaby, wolverine, marten, American opossum, kolinsky, and wild cat.

He also states that—

> Spring prices were realized for silver fox, jackal, and American and Russian badger; but for kangaroo, chinchilla, mole, and Japanese fox there was practically no sale.[3]

TARIFF HISTORY 1883–1913.

Raw furs.—The language relating to furs undressed and fur skins undressed has been substantially the same in all tariff acts beginning with that of 1883. No duty was imposed by any of the acts.

[3] Commerce Reports, Dec. 7, 1920.

Dressed furs.—A duty of 20 per cent ad valorem was imposed by the act of 1883. No change was made in the rate until 1913, when it was increased to 30 per cent. In the acts of 1890, 1894, and 1897 dressed furs were restricted to "furs dressed on the skin, but not made up into articles." The act of 1909 substituted "not advanced further than dyeing but not repaired" for "not made up into articles." The wording of the 1913 act is the same as that of 1909 with the exception of "but not repaired" which, owing to the doubtful meaning of the word repaired, was omitted.

Hatters' fur.—The tariff act of 1883 provided for a 20 per cent ad valorem rate on hatters' fur not on the skin. The rate remained unchanged in all subsequent tariff acts until the act of 1913, which reduced the rate to 15 per cent.

The act of 1894 was the first to contain a specific provision relating to dressed furs suitable only for use in the manufacture of fur hats. This act placed them on the free list, but in all subsequent acts they were placed in the dutiable list at the same rate of duty as that on hatters' fur not on the skin.

Manufactures of fur.—The act of 1883 contained a separate paragraph relating to articles made of fur not specially enumerated or provided for, while the acts of 1890, 1894, and 1897 contained specific provisions for manufactures of fur; the provisions, however, were not given a separate paragraph. The act of 1909 increased the number of specific provisions relating to furs, but failed to provide specifically for manufactures of fur not provided for. The act of 1913, in addition to the articles enumerated, contains a provision for manufactures of fur not specially provided for. The rates of duty under the acts of 1883, 1890, 1894, 1897, and 1913, were, respectively, 30, 35, 30, 35, and 40 per cent ad valorem.

Manufactures of fur for use as material.—The act of 1909 was the first to provide specifically for this class of merchandise. The provision reads "manufactures of furs, further advanced than dressing and dyeing when prepared for use as material, including plates, lining, and crosses." The act of 1913 goes further than that of 1909 by distinguishing between plates and mats of dog and goat skins and those of other skins, the former being dutiable at 10 per cent and the latter at 40 per cent. The act of 1909 made all plates and mats dutiable at 35 per cent.

Wearing apparel.—It was not until the act of 1909 that specific provision was made for articles of wearing apparel composed of fur, previous to which they came under the general description of manufactures of fur. The rate of duty was 50 per cent ad valorem. The act of 1913 provided for two classes of wearing apparel, (1) those composed of the skins of cattle of the bovine species or of the dog or goat; and (2) those composed of fur not specially provided for. The rates under the 1913 act are 15 and 50 per cent, respectively.

COMPETITIVE CONDITIONS.

Raw skins are imported free of duty into all countries except Russia. This international free trade may be accounted for by the fact that furs of different countries are not directly competitive with each other. The furs of one country are in demand in another and vice versa. Furs are not only referred to by species but by region where obtained as well. As the quality of the fur varies greatly ac-

cording to the region where obtained, it may be said that furs of the same specie of animals are not competitive with each other. Fashion governs very largely the kinds of furs used without regard to the country of origin. Use of all kinds of furs has been very popular for the past few years.

Competition lies chiefly in marketing the furs. The Hudson's Bay Co. have for many years sold their furs at auction in London. In 1916 there was organized in New York a corporation to handle fur sales. Auction sales are held three times a year and consignments of furs are received from all parts of the world. There are auction sales of similar character conducted in St. Louis.

It has been generally recognized that the Europeans excel in the art of dressing and dyeing furs. England has long maintained its position as leader in this branch of the fur industry, notwithstanding many attempts to wrest the supremacy from her. The excellence of the English dyeing and dressing has been attributed to the peculiar property of the water and to secret processes and methods. Seal dyeing was largely in the control of one man, who practically enjoyed a monopoly. Until 1913 the United States Government's sealskins were sent to London to be dressed and dyed, but they are now treated and sold in St. Louis. The dyeing and dressing establishments at Leipzig and other centers in Germany were also noted for the excellence of their work.

The French influence upon the trade is primarily one of style and combination of colors. Many of the lower grade furs brought into this country were dressed and dyed abroad. All of the best sealine and seal dyed rabbit skins came from Germany, France, and Belgium. Although the American dressers and dyers were becoming more successful up to the time of the war, it was not until then that the great opportunity came to them to become the leaders in their industry. To-day American dyers and dressers are producing furs which are said to be unrivaled in color, sheen, suppleness. strength, and beauty. The rapid development in this country in the production of fur colors, which up to 1914 were imported from Germany, has been a material aid to dressers and dyers.

American fur dressers and dyers have stated at tariff hearings that they have found it impossible to compete with the cheaper foreign labor, especially with that employed on the poorer grades of furs. Domestic producers of hatters' fur have stated in the past that labor cost in Europe is from 45 to 52 per cent less than in the United States, that substantially all chemicals with which the fur is treated are cheaper abroad than here, and that they have been able to maintain the advantage over the foreigner only through quick deliveries and granting of liberal lines of credit.

Whether the American dressers and dyers will be able to maintain their leadership against their foreign competitors when conditions become settled in Europe remains to be seen. New competitors may enter the field, as it has been reported that the Swiss on account of the stagnation of the Leipzig fur market have started establishments for the treatment of furs.

TARIFF CONSIDERATIONS.

In 1917 when war-revenue taxation was under consideration it was proposed to place a duty of 10 per cent on all the articles in

the free list, including furs and fur skins undressed, and to increase the duty on the manufactured product by an equal amount. This met with opposition from the fur trade. It was maintained that demoralization would result from placing a duty on this raw material, which has been free for some time.

Paragraph 603, "skins of hares, rabbits, dogs, goats, and sheep, undressed," should be eliminated, as the provisions in paragraph 491, "furs and fur skins, undressed," and 604, "skins of all kinds, raw, and hides not specially provided for," cover the paragraph in question.

The act of 1913 contains no specific provision for sheepskin plates and mats. Such articles are subject to a duty of 40 per cent under paragraph 348 as against 10 per cent on plates and mats of dog and goat skins. Plates and mats of sheepskin are practically of the same quality and are used for similar purposes as those of dog and goat skins.

A strict interpretation of paragraph 348 would impose a duty of 30 per cent on dressed dog and goat skins, which apparently was not the intention of Congress in view of other provisions in the same paragraph, namely, 10 per cent on plates and mats of dog and goat skins and 15 per cent on wearing apparel composed of the skins of dogs and goats. There being no other provision in the tariff which includes them directly, they have been held dutiable at 10 per cent by similitude to plates and mats of dog and goat skins.

Questions have arisen whether dressed animal skins with the wool or hair on and intended for use as fur are within the terms "wools" or "hair," paragraphs 286, 304, and 650. It has been held that such skins, if for fur uses and if it is unprofitable to separate the wool or hair from the skin and use it for wool or hair purposes, are not within the terms "wools" or "hair," but are properly classifiable as "furs," which are not limited strictly to fur-bearing animals.

The most recent data relating to the domestic production of furs in Canada are for 1910, in which year the value of the principal classes of skins and furs of wild animals collected was:

Kind of fur.	Number.	Value.
Assorted	.....	$445,320
Bear	4,509	44,923
Beaver	24,895	131,833
Fox	17,589	222,145
Lynx (including wildcat)	8,159	114,756
Marten	31,437	221,583
Mink	45,973	221,500
Muskrat	915,754	256,213
Otter	5,721	102,291
Seal (fur)	5,108	32,997
All others	91,036	133,989
Total	.....	1,927,550

The production of furs in Canada in 1910 was more than double that of 1900, the value increasing by 114.25 per cent during the decade. It is said that while fur values have risen in recent years the number of skins collected shows a decrease in each class on account of the gradual settlement of previously uninhabited regions.

COURT AND TREASURY DECISIONS.

Dressed animal skins with the wool or hair on, when unprofitable to separate the wool or hair from the skin and use it for wool or hair purposes, are not within the terms "wools" or "hair" (pars. 286, 304, and 650), but are, if devoted to fur uses, within the word "furs" in paragraph 348 which is not limited to products of strictly fur-bearing animals, but include sheepskins with wool on when devoted to fur uses and not bearing so great an amount of wool as to make it commercially practicable to remove the wool and use it for wool purposes. *Sheepskins, entire, or pieced by sewing in the*

shapes of rectangles and crosses with the natural growth thereon and the flesh side dressed, used as ordinary fur skins are used, and not bearing wool to the extent making removal of the wool commercially practicable, are within the provision for "furs dressed on the skin." (Ayers *v.* United States, 8 Ct. Cust. Appls., 87, of 1917.) *Hair too short to be commercially spun into yarn or for the making of textiles* and chiefly employed in the making of furs or fur garments, or for other fur uses, is that kind of hair which is known as fur, though it be taken from the back of a sheep. The hair of the Angora rabbit resembles that of the Angora goat or alpaca more nearly than it does that of the sheep or the camel. (Bloomingdale *v.* United States, 8 Ct. Cust. Appls., 104, of 1917.) Crosses made of dressed kidskins sewed together are within paragraph 348 as manufactures of fur prepared for use as material joined or sewed together and not as plates and mats of goatskins. It is not material for the purposes of this provision that goatskin crosses might to some extent have been imported if it is shown that they are not commonly imported in that form. With proof that kidskins and goatskins are different things commercially, the provision for goatskin articles will be held not to include kidskin articles. With proof that "crosses" and "plates" as applied to articles made of fur skins have distinct meanings, a cross can not be dutiable as a plate under paragraph 348. (Seward *v.* United States, 9 Ct. Cust. Appls., 4, of 1918.) *Sheepskins tanned* and dressed and sewed in the form of rugs and commonly known in the trade as plates made from China sheepskins and apparently used in the making of fur robes for baby carriages are manufactures of fur within paragraph 348. (Abstract 42322, of 1918.)

Dressed goatskins and *dogskins* are dutiable at 10 per cent by similitude to goatskin and dogskin plates and mats under the second provision of paragraph 348, there being no provision in the tariff which includes them directly. (G. A. 7569, T. D. 34493, of 1914; Abstract 36623, of 1914, T. D. 34237, of 1914.) But *China goatskin mats and rugs* made up into completed articles are dutiable at 15 per cent under paragraph 348. (T. D. 34544, of 1914.) Men's gloves having leather fingers, fur backs, and lined with fur and wool, were held dutiable as fur wearing apparel under paragraph 348. (Abstract 36969, of 1914.) *Fur pieces* or *clippings* cut from dressed and dyed rabbit skins, used for trimming slippers, etc., were held dutiable under the first provision of paragraph 348. (Abstract 37558, of 1915.)

FEATHERS, ARTIFICIAL FLOWERS, AND MILLINERY ORNAMENTS.

SUMMARY.

This survey deals particularly, but not exclusively, with manufactured flowers and feathers suitable for millinery ornaments, although the statistical data include all classes of artificial flowers and fruits, and common feathers as well as ornamental feathers.

There were 456 establishments engaged in the flower and feather industry in 1914, capitalized at $8,745,000, employing 9,291 wage earners, and turning out a product valued at $19,065,000. It is estimated that there were more home workers than factory workers engaged in the industry; in fact, only a few firms carry on all the work on flowers in factories. It is an industry employing mostly women and hand labor, 81.4 per cent of the factory workers being women.

The industry is located almost wholly in New York City, 85.8 per cent of the total value of products being credited to that city in 1914. It is a seasonal industry and faces periods of unemployment. It is thus difficult to retain labor in the trade. Present wages paid in the industry are not known in detail, but the prevailing wages have always been low in comparison with other industries. The individual form of ownership prevails and the size of establishments is usually small. The few large factories, however, turn out the greater part of the total output.

The number of workers in the French artificial flower and feather industry is probably double that in the American industry. Flower makers in France and Germany remain in the trade and become more skilled than workers in the American industry. The season of unemployment is usually not so long as in America. The greatest advantage possessed by the French industry is its superiority in designing, which makes France the leader in styles. So long as this situation exists the demand for French flowers and feathers will persist. The high quality of their workmanship is also an important factor. Many small flowers requiring a great deal of patient hand labor are made in Germany.

Imports for consumption before the war were about 50 per cent of the value of domestic products. During the war imports declined from a total value of $12,442,828 in the fiscal year 1913 to $2,692,621 in the fiscal year 1918. The figures for the fiscal year 1920 show an increase in imports over 1918, crude ostrich feathers reaching a total value of $2,015,326, and flowers and feathers suitable for millinery ornaments reaching a total value of $2,256,869, largely from France. Other classes have not shown much increase since the close of the war.

As long as style is the principal factor in the trade, and as long as Paris sets the style as well as produces flowers and feathers of supe-

rior workmanship, there will be a demand for imported flowers and feathers. The American producer will probably never attempt to make many of the small flowers imported from Germany which require so much painstaking labor. The domestic production of common feathers for beds and pillows is not sufficient to supply the demand.

Feathers, artificial flowers, and millinery ornaments—Summary table.

General Information.

1913 TARIFF PARAGRAPH.

347. Feathers and downs, on the skin or otherwise, crude or not dressed, colored, or otherwise advanced or manufactured in any manner, nor specially provided for in this section, 20 per cent ad valorem; when dressed, colored, or otherwise advanced or manufactured in any manner, and not suitable for use as millinery ornaments, including quilts of down and manufactures of down, 40 per cent ad valorem; artificial or ornamental feathers suitable for use as millinery ornaments, artificial and ornamental fruits, grains, leaves, flowers, and stems or parts thereof, of whatever material composed, not specially provided for in this section, 60 per cent ad valorem; boas, boutonnieres, wreaths, and all articles not specially provided for in this section, composed wholly or in chief value of any of the feathers, flowers, leaves or other material herein mentioned, 60 per cent ad valorem: *Provided*, That the importation of aigrettes, egret plumes, or so-called osprey plumes, and the feathers, quills, heads, wings, tails, skins, or parts of skins of wild birds, either raw or manufactured, and not for scientific or educational purposes, is hereby prohibited; but this provision shall not apply to the feathers or plumes of ostriches, or to the feathers or plumes of domestic fowls of any kind.

DESCRIPTION.[1]

Artificial flowers.—This classification includes the output of establishments engaged in the manufacture of artificial leaves, palms, grasses, wreaths, plants, foliage, and vines, thorns, buds and fruits, wax flowers, and in the preservation of flowers and

[1] Abstract of the Census of Manufactures, 1914—pp. 239, 240.

plants, stems, tubing, and other materials for use in the manufacture of artificial flowers. 'There is considerable overlapping between this industry and "feathers and plumes." * * * In addition, artificial flowers to the value of $820,520 were reported in 1914 by establishments assigned to other classifications, principally "feathers and plumes."

Feathers and plumes.—This classification includes the output of establishments producing fancy feathers, plumes—horse, theatrical, hearse, military, and society—boas, muffs, and quills, and also those engaged in the dyeing, curling, and renovating of ostrich feathers. * * * In addition, feathers and plumes to the value of $1,339,869 were reported for 1914 by establishments assigned to other classifications, principally "artificial flowers" ($1,101,223), "house-furnishing goods" (feather pillows and beds), and "millinery and lace goods" (trimmed hats and hat frames).

DOMESTIC PRODUCTION.[1]

(*a*) *Size and importance of the industry.*—There were 456 establishments reported in 1914 engaged in the combined artificial flower and feather and plume industries. They employed 9,291 wage earners and their capital was $8,745,000, with a product valued at $19,065,000.

The two industries were quite evenly divided as to number of establishments and the number of wage earners employed, but the value of products of the feather and plume industry was nearly $3,000,000 in excess of that of the artificial flower industry. The home manufacture of flowers is very extensive, but the number of people employed in this manner is not, of course, included in the above figures.

(*b*) *Concentration in New York.*—Only one industry in 1914, according to the Census of Manufactures, showed a greater degree of concentration in one State and one city than did flowers and feathers and plumes. New York City was credited with 85.8 per cent of the total value of products of the flower and feather industry. Not only is the industry concentrated in New York City, but in one section of the city, namely, between Prince and Fourteenth streets.

(*c*) *A seasonal industry.*—Flowers and feathers are both seasonal industries, and when their manufacture is carried on in the same establishment they have a tendency to fit together, so that the slack season in feathers is the busy season in flowers. The average number employed in the flower industry in 1914 was 4,808, the maximum number being 5,418 in November and the minimum number being 3,840 in June. The average number in the feather industry for the year was 4,483, while the maximum was 5,391 in September and the minimum 3,829 in December. However, since flowers and feathers are not usually manufactured in the same factory, and since many employees will not work on both flowers and feathers, each industry has a slack season of about four months or more, during which many employees must be "laid off."

(*d*) *Women and hand labor.*—Both flowers and feathers are manufactured principally by women, and almost wholly by hand labor. In 1914, 81.4 per cent of the total number employed were women, 4.1 per cent were wage earners under 16 years of age, and 14.5 per cent were men. Men were employed in cutting and dyeing flowers and in dyeing feathers, but practically all the other processes are carried on by women and children. Home workers are not included in the above figures.

[1] Artificial flower makers, Mary Van Kleeck, 1913.

That practically no machine processes are used is shown by the fact that for the year 1914 in the State of New York the total horsepower—steam, gas engine, and electric—used in 369 establishments was only 450—148 horsepower for the flower industry and 302 horsepower for feathers. In the very nature of the case large-scale machine processes can not be used, and inasmuch as standardization of product and mass production is contrary to the rules of fashion, a large value of output per establishment, with a low unit cost of production is not to be expected.

(e) *Hours of work.*—In 1914 the majority of wage earners were employed in factories where the prevailing hours of work per week were 48 to 54, while nearly 1,500 were employed in factories working less than 48 hours. About one-third were employed in factories working 54 hours. A few were employed in factories having more than 54 hours per week, and 19 were employed in the feather industry where the prevailing hours were from 60 to 72 per week.

(f) *Wages.*—The wages paid were very low. The following quotation from an investigation made by the Russell Sage Foundation indicates the prewar rate of wages: "In nearly four-fifths of the shops investigated, 88 in number, employing 4,169, or 80 per cent of the total number of women in the trade, the highest weekly wage received by any woman was less than $15, while 39 per cent were in shops in which the maximum never reached $12." According to the census figures of 1905, more than half of the women employed (55.3 per cent) in the flower and feather industry earned less than $6 a week during a busy week of the year, slightly more than one-fourth (483) earned $8 or over, and only about 1 in 16 rose to $12 or over. Weekly wage statistics have not been compiled in later census reports.

(g) *Home work.*—The following extract from "Artificial flower makers," by Mary Van Kleeck, indicates the extent of home work in the flower industry:

> Of the 114 firms investigated only 24 stated that all the manufacturing was done in the workroom. The remaining 90 reported that they gave out part of their work to home workers. The statements of 76 of these firms showed that they had on their pay rolls between 2,200 and 2,400 families who made flowers at home. They had no records of the number of individual workers reported in these families, but judging from our investigations of a group of home workers, three in a family is a low average. Thus, according to the reports of employers, home workers in this trade in New York must number about 7,000 and are more numerous than employees in the shops.

(h) *Value of products.*—The total value of products of the flower and feather industry in 1914 was $19,065,000, of which $7,614,000 was flowers and $11,451,000 was feathers and plumes.

The cost of materials used for artificial flowers was $3,207,000. Therefore the value added by manufacture was $4,407,000, or about 58 per cent of the total. The cost of materials used in the feather industry was $6,102,000; therefore $5,349,000, or about 47 per cent of the total, was added by manufacture.

Flower making, materials, and processes.—The raw materials used in making flowers are chiefly muslin, silk, and velvet. Usually white is used, and the color is applied later. A strip of the cloth, generally a yard and a half long, is first stretched on a frame, and starch is applied with a brush. If leaves are to be made, the color is applied to the cloth on the frame. The cloth is next cut into petals. The tools used are a steel die or stamp, a lead block, and a wooden mallet.

The petals are sent to the dyer, who copies the color from the design or model. Sometimes petals are stenciled, as in the case of orchids. The finished petals are dried between sheets in a wire frame, frequently in a room artificially heated. These processes of starching, cutting, and dyeing are usually done by men.

The work of the women, either at home or in the shops, consists of preparing, making, and branching. To "prepare" the petals means to shape them by curling their edges, pinching them between the fingers, or "goffering" them. Goffering is the making of the cup-like shape of a petal and is done with a tool consisting of a ball at the end of a handle. This ball is heated on a gas stove and applied to the petal as it rests on the palm of the hand. Crimping machines are used in some factories for the cheaper flowers. These machines curl the edges of a number of petals at one time and usually punch a hole in the petal at the same time.

"Making" includes the various processes of arranging the petals to form a flower and attaching them to a stem. In the higher-grade flowers each petal is pasted in its place, but in the cheaper flowers they are "slipped up"—that is, the stem is inserted through a hole in each petal, which is then slipped up into its place and held with paste. The latter process requires neither taste nor skill, but demands speed. Leaves are sometimes made in separate factories. After the leaves have been cut, a stem is pasted on each leaf. The leaf is then veined on a pressing machine moved by a handwheel.

When flowers and leaves are completed they are brought together and arranged to appear pleasing to the customer. This is called branching and is considered the most important work in the trade.

The work of designing is of the utmost importance to any flower manufacturer, since the product must be popular in order to find ready sale. Practically all of the leading designs are imported from Paris. The cheaper flowers are usually a copy or imitation of the higher class product. Manufacturing is usually done to fill orders taken on the samples shown, since the risk involved in making up stock in advance is great. This fact is a further cause for the slack season in the industry. The finer the flower the more important it is that it be produced by one hand, and in the higher grade establishments each worker prepares and makes the whole flower.

Feather making.[1]—As in flower making, dyeing is one of the most important processes, and it is done by men. The processes carried on by women are "stringing" or tying the feathers at intervals on a cord in preparation for dyeing; "steaming" them, or holding them over boiling water, to make them pliable or to give them certain effects; and "preparing" or cleaning and sorting the feathers.

The prepared feathers are pasted or sewed on frames in different designs, such as heads, breasts, and wings; or they may be wired or branched into various styles of feather ornaments. The last process is stemming or papering the free ends of the wire.

(*a*) *Organization.*—Artificial flowers: There were 217 establishments reported in 1914 engaged in the manufacture of artificial flowers, with a total capital of $3,349,000, or an average individual capital of $15,433. The total average number of wage earners employed was 4,808, or approximately 22 in each establishment. While by far the

[1] See Artificial Flower Makers, Mary Van Kleeck.

greater number of establishments employed less than 50 wage earners, 11 employed between 51 and 100, or 16.1 per cent of the total number, and 11 others employed between 101 and 250, or 33.4 per cent of the total number.

More than one-half of the flower establishments turned out a product of less than $20,000 each, 65 establishments turned out a product between $20,000 and $100,000 in value, and 22 establishments turned out products between $100,000 and $1,000,000 in value, with an aggregate practically equal to all the others combined.

There were 137 flower establishments owned by individuals, 33 by corporations, and 47 by some other form of ownership. These different classes employed nearly the same number of wage earners and turned out products of nearly equal value, except that the corporations were somewhat less in number and value of products.

(*b*) *Feathers and plumes.*—The feather and plume industry was credited with 239 establishments in 1914, having a capital of $5,396,000, or an average individual capital of $22,577. They employed 4,483 wage earners, or an average of 19 in each establishment. By far the greater number employed only a small number of wage earners, 219 out of 239 employing not over 50 wage earners, while 14 employed from 51 to 100, and only 6 employed between 101 and 250.

Nearly one-half of the establishments manufacturing feathers (111), turned out a product valued at not over $20,000 each; 93 turned out products valued at between $20,000 and $100,000; and 35 produced between $100,000 and $1,000,000. The output of the 35 establishments was greater in value than all the others combined.

There were 133 establishments owned by individuals, 47 by corporations, and 59 by some other form of ownership. They employed approximately the same number of workmen, but the establishments owned by some other form turned out products valued at about $300,000 more than the value of the products of each of the other two classes.

From this it will be seen that the flower and feather industries are carried on mainly by individual and small factories or shops, although the large factories furnished a large share of the total output.

Geographical distribution.—The total value of the products of the feather and plume industry in 1914 was $11,451,000, of which New York State furnished $10,274,000. Pennsylvania furnished a product valued at $787,000, and California furnished $159,000 of the total.

Artificial flowers were also produced largely in New York, the total for the industry in 1914 being $7,614,000, while New York's total was $6,181,000. Pennsylvania was second with a total of $688,000, and Illinois third with a total of $348,000.

Domestic production and consumption.—Imports for consumption of flowers and feathers prior to the war were about equal to one-half the value of domestic products, while exports of domestic products were very small. The demand for the imported flowers and feathers has not much relation to the tariff.

French flowers are undoubtedly superior, as a rule, to American-made flowers. This is due to greater skill and experience on the part of French flower makers and particularly to the French superiority of designs. Low wages and periods of unemployment in the American industry are not conducive to skill and constancy to the trade.

Ostrich feathers originate mainly in South Africa and must be imported, since the ostrich industry in the United States is very small. Other feathers and millinery ornaments are also imported in large quantities. As long as America looks to Paris for its styles it is reasonable to assume that imports of flowers and feathers will continue to be large. Improvements in design and execution by American makers will be necessary if the ratio of imports to domestic production is to be reduced.

Domestic exports.—Domestic exports are very small, averaging a little over $300,000 annually since 1910, except in 1913 and 1914, when they were double that amount. Exports of feathers only are given. They went principally to Canada and to the European countries.

The ostrich industry.—Detailed information regarding the ostrich industry is given in the auxiliary file of this survey, pages 15 to 25. Ostrich farming was first undertaken in South Africa late in the sixties, and grew to large proportions until checked by the war in 1914. In 1913 it was estimated that there were at least 900,000 ostriches in South Africa. In 1913 a pair of the best breeding ostriches easily sold for $5,000 in South Africa, and the prime feathers (perfect white wing feathers from the cock birds) brought from $120 to $140 a pound (about 90 feathers to a pound). An ostrich yields about 1½ pounds of feathers annually which, before the war, averaged about $20 to $30 in value. Exports of ostrich feathers from South Africa in 1913 were valued at $14,600,000.

The ostrich industry in the United States began to develop about 1900, when there were about 500 birds in this country. In 1910, according to the Census of Agriculture, there were 5,349 ostriches in the country, of which 4,028 were found in Arizona, 1,082 in California, 147 in Arkansas, and 92 in Florida. According to A. R. Lee, Bureau of Animal Industry, Circular 172, there were 6,100 breeding or feather-producing ostriches in the United States in January, 1910. A pair of breeding birds in this country was valued at about $800.

The war destroyed the feather market. Import restrictions in England and later in the United States, and the lack of shipping space for this trade, caused a practical cessation in the use of ostrich feathers. The number of birds declined rapidly and feathers sold in 1917 in South Africa at the low averge of $2.70 to $3.25 a pound. The number of birds in South Africa was reduced by at least 50 per cent. The industry in the United States was practically abandoned. Mr. Lee now states (April, 1920) that there are at present probably 500 to 600 birds in this country.

The present demand for feathers is again good and the price is fair, so that it may be expected that the industry will soon regain some of the lost ground. In Arizona, however, the farms formerly devoted to ostrich farming are now put to other uses, and doubt is expressed as to whether they will again raise ostriches.

FOREIGN PRODUCTION.[1]

Paris is the center of the artificial flower industry and is looked to for the "style." The Employers' Syndicate includes 500 shops in

[1] Artificial Flower Makers, 1913, Mary Van Kleeck.

its membership, and, in addition to these, Paris contains many small contract shops which are not admitted to the syndicate.

The president of the syndicate estimates the total number of women flower makers working in the shops and at home in Paris and its surrounding districts to be 30,000, while the flower and feather maker's union believes that there are 28,000 workers in the trade, of whom 3,000 are men and 25,000 women. Of these women, 15,000, the union estimates, work at home and 10,000 work in shops. These figures show that probably more than twice as many women are employed in the artificial-flower industry in Paris as in shops and home work in New York.

Except in exclusive shops, where it is carried on as an art, the making flowers in Paris has become similar to that in New York. The demand for quantity production has replaced the more artistic product, which required a great deal of time and was costly. A number of hours might be spent by one person on a single fine flower.

Seasonal unemployment is similar to that in New York, although not so long in duration. Wages varied from $14 a week for the best flowers to about $5 per week for the cheaper flowers, with many workers earning less than $5. It does not appear that there was much difference in the average wages paid in New York and Paris. The wages earned by home workers were also about the same.

The above comments on the artificial-flower industry apply also to the shops working with feathers, some of the shops working on both flowers and feathers. The demands of the styles and seasons determine largely the output of the shops.

London is the principal feather market of the world, and consequently many of the imports into the United States come from England. This does not indicate that they are of English production. Ostrich feathers originate in South Africa. Imports of manufactured feathers come principally from France, and other millinery ornaments, flowers, fruits, grains, etc., come from Germany and France.

IMPORTS.

Imports of ostrich feathers, crude, reached a total value of $6,252,298 in the fiscal year 1913, coming from England and South Africa, but originating almost wholly in South Africa. The value of imports of this class decreased to $534,921 in 1917.

Imports of other crude feathers and downs amounted to nearly $2,000,000 in 1913, of which $1,299, 928 came from France. England furnished the next largest amount. Some feathers of this class also came from Germany, China, and Hongkong.

The value of imports of manufactured feathers not suitable for millinery purposes averaged about $1,500,000 before the war, about two-thirds of which came from France and about one-third from Germany. The value of this class of feathers has been almost insignificant since 1915.

Imports of millinery ornaments, including feathers, flowers, and fruits, reached a total value of $3,131,972 in 1914, and have not decreased in value as much as the various classes of feathers, the low figure of $1,013,509 having been recorded in 1918. Imports of this class came from France and Germany in almost equal value before the war, but since the war have come almost wholly from France.

The figures for the most important classes of imports for consumption are diagramed on the following page. Curve No. 1 represents the importation of crude or unmanufactured ostrich feathers; Curve No. 2

represents the imports of ornamental flowers, feathers, grains, etc., not specially provided for; Curve No. 3 represents the imports of manufactured ornamental feathers, exclusive of a small amount of manufactures ostrich plumes; and Curve No. 4 represents the imports of crude ornamental feathers for millinery purposes classified as "all other."

It will be seen from the diagram, that the greatest decrease has been in the imports of crude ostrich feathers. Changes of fashion no doubt had something to do with this reduction of imports, but it is clear that the importation of all kinds of millinery ornaments gradually declined until the four classes touched the $500,000 mark in 1918. This figure represents roughly 8, 20, 28, and 30 per cent, respectively, of the imports of the classes of products named above for the peak year of 1913.

Imports by countries for the calendar years 1919 and 1920 indicate that the trade in the two principal classes of flowers and feathers has been on the increase. Ostrich feathers, crude, valued at $2,698,146 in 1919, and $1,088,111 in 1920, were imported, compared with a total of $746,709 in the fiscal year 1918. The class of millinery ornaments, which consists principally of artificial flowers, fruits, etc., showed an increase of $842,730 over the fiscal year 1918, or a total value of $1,856,239 for the calendar year 1919, of which $1,717,495 came from France. For 1920 the total increased to $3,270,257.

IMPORTS FOR CONSUMPTION OF FLOWERS AND FEATHERS.

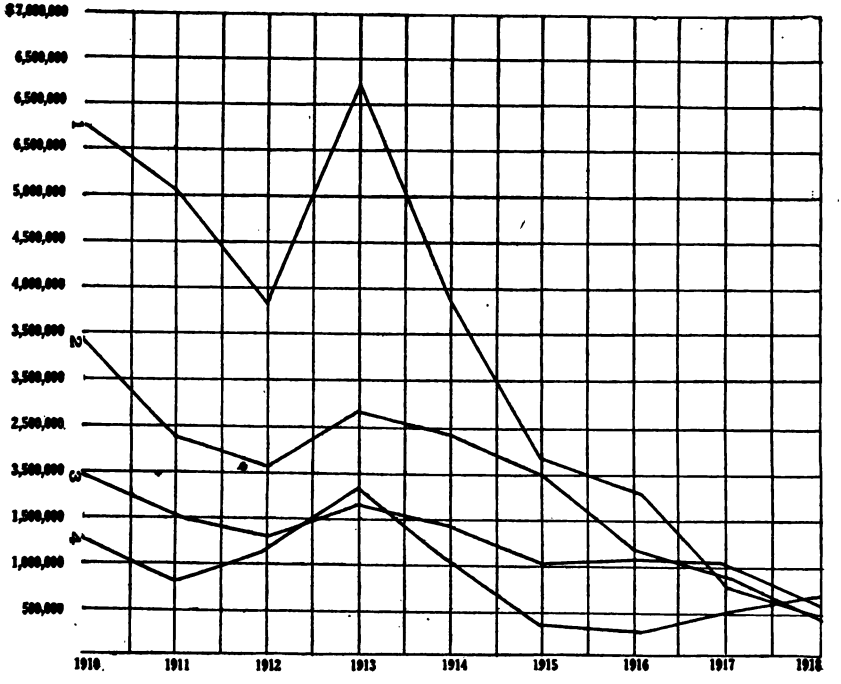
CURVE 4.—Crude ornamental feathers—"all other."



PRICES.

The number of varieties of millinery ornaments is so great and the style changes so frequently that it is not considered of much value to quote prices. Imported and domestic articles are also rarely directly comparable. Many of the smaller flowers, such as forget-me-nots and very small roses, requiring a great deal of painstaking hand labor, are practically not made in this country, so that imports frequently are supplementary and not competitive. Furthermore, articles which may be competitive are difficult to compare, because of variation in color or shade, or material and workmanship.

The following prices are given merely as a suggestion of the range of prices on some more standard articles (wholesale prices):

Domestic wreaths, mixed—flowers, fruits, grasses, $6 to $48 a dozen; imported wreaths, $6 up. Pansies, imported, small, 7 in bunch, $12 a dozen bunches; pansies, imported, large, 5 in a bunch, $15 a dozen bunches. Violets, domestic and imported, $13.50 a dozen bunches. Roses, from $3 a dozen bunches for little June roses, to $7.50 and up a dozen for larger roses. A good quality rose of fair size usually costs from $12 to $24 a dozen, although much higher prices prevail for the finest quality.

Forget-me-nots, imported only, $3 a dozen bunches.

Leaves (foliage), $3 to $4.50 and up, a dozen bunches.

Ostrich feathers range in price from $6 to $60 per dozen at the present time. All kinds of imitation feathers are made, since the prohibition of imports of the feathers and plumes of wild birds.

The price of superior white goose feathers in 1920 (Chinese) was 55 cents a pound, more than double what it was in 1915. This price is c. i. f., New York, less duty. Superior Szechuan duck feathers (Chinese), cost 13 cents a pound in 1915 and in 1920 cost 35 cents, c. i. f., New York.

TARIFF HISTORY.

The act of 1894 imposed a duty of 35 per cent ad valorem on feathers, flowers, fruits, etc., when suitable for millinery ornaments, and also including quilts and manufactures of down. Feathers and downs for beds and crude feathers and downs of all kinds were placed on the free list.

The act of 1897 assessed crude feathers and downs at 15 per cent ad valorem, and manufactured flowers and feathers and millinery ornaments of all kinds at 50 per cent ad valorem.

The act of 1909 raised these rates to 20 per cent and 60 per cent ad valorem, respectively.

The act of 1913 retained the rates of 20 per cent for crude feathers and created a new class—feathers manufactured but not suitable for millinery ornaments—at 40 per cent. The rate on artificial and ornamental feathers and other millinery ornaments remained at 60 per cent ad valorem. The act of 1913 also prohibited the importation of aigrettes and the feathers of wild birds, except for scientific or educational purposes.

COMPETITIVE CONDITIONS AND TARIFF CONSIDERATIONS.

Salesrooms of dealers in flowers and feathers appeared to have quite large stocks of imported flowers in the spring of 1920, but

retailers were not heavily stocked with imported goods. Dealers did not think that there had been a dumping of goods as had been anticipated; in fact, there is no indication of an oversupply. Buyers appear anxious to get imported flowers and are going abroad for them.

While American producers have improved the quality and style of their output since the beginning of the war, it is not at all certain that the improvement has been such as to permanently secure to them a larger share of the trade than before the war.

The American manufacturer faces the same labor problems as before the war; that is, labor will not remain permanently in the trade, wages are higher than formerly, and in addition, the cheap home labor is being eliminated to some extent. While home labor still exists, it is said to be higher priced in proportion to factory labor than before the war, because there are so many opportunities to earn better wages.

It has been commonly recognized in the trade that style and quality of workmanship are controlling factors in this industry and that cost of production and price are relatively less important factors. Until the American manufacturers create superior or more popular styles and turn out workmanship of equally high quality, the demand for imported flowers will probably persist whether the duty is high or low. The American manufacturer will probably never attempt to make the small flowers requiring so much patient hand labor.

The dependence of American fashions on foreign styles will also continue to influence the demand for imported goods. While conditions abroad are very unsettled and prices have been advancing materially, still it appears quite certain that the demand for imported flowers and feathers will be great and the competition from abroad will again become keen.

The domestic supply of common feathers for beds and pillows does not meet the demand

Statistical Tables.

Feathers, artificial flowers, and millinery ornaments[1]*—Production in United States.*

[From Federal census.]

Year.	Value.	Year.	Value.

Artificial and ornamental flowers and feathers—Rates of duty.

Act of—	Par.	Tariff classification or description.	Rates of duty, specific and ad valorem.
1883	429	Feathers of all kinds, crude or not dressed, colored or manufactured.	25 per cent ad valorem.
1883	429	When dressed, colored, or manufactured, including dressed and finished birds, for millinery ornaments and artificial and ornamental feathers and flowers, or parts thereof, of whatever material composed, for millinery use, not specially enumerated or provided for in this act.	50 per cent ad valorem.
1883	650	Bed feathers and downs	Free.
1883	652	Birds, stuffed	Do.
1890	443	Feathers and downs of all kinds, crude or not dressed, colored, or manufactured, not specially provided for in this act.	10 per cent ad valorem.
1890	443	When dressed, colored, or manufactured, including quilts of down and other manufactures of down, and also including dressed and finished birds suitable for milinery ornaments, and artificial and ornamental feathers and flowers, or parts thereof, of whatever material composed, not specially provided for in this act.	50 per cent ad valorem.
1890	504	Birds, stuffed, not suitable for millinery ornaments, and bird skins, prepared for preservation, but not further advanced in manufacture.	Free.
1890	567	Feathers and downs for beds	Do.
1894	328	Feathers and downs of all kinds, when dressed, colored or manufactured, including quilts of down and other manufactures of down, and also including dressed and finished birds suitable for millinery ornaments and artificial and ornamental feathers, fruits, grains, leaves, flowers, and stems, or parts thereof, of whatever material composed, suitable for millinery use, not specially provided for in this act.	35 per cent ad valorem.
1894	400	Bird skins, prepared for preservation, but not further advanced in manufacture.	Free.
1894	477	Feathers and downs for beds, and feathers and downs of all kinds, crude or not dressed, colored, or manufactured, not specially provided for in this act.	Do.
1897	425	Feathers and downs of all kinds, including bird skins or parts thereof with the feathers on, crude or not dressed, colored, or otherwise advanced or manufactured in any manner, not specially provided for in this act.	15 per cent ad valorem.
1897	425	When dressed, colored, or otherwise advanced or manufactured in any manner, including quilts of down and other manufactures of down, and also dressed and finished birds suitable for millinery ornaments, and artificial or ornamental feathers, fruits, grains, leaves, flowers, and stems, or parts thereof, of whatever material composed, not specially provided for in this act.	50 per cent ad valorem.
1897	493	Birds, stuffed, not suitable for millinery ornaments	Free.
1909	438	Feathers and downs of all kinds, including bird skins or parts thereof with the feathers on, crude or not dressed, colored, or otherwise advanced or manufactured in any manner, not specially provided for in this section.	20 per cent ad valorem.
1909	438	When dressed, colored, or otherwise advanced or manufactured in any manner, including quilts of down and other manufactures of down, and also dressed and finished birds suitable for millinery ornaments, and artificial or ornamental feathers, fruits, grains, leaves, flowers, and stems, or parts thereof, of whatever material composed, not specially provided for in this section.	60 per cent ad valorem.
1909	438	Boas, boutonnieres, wreaths, and all articles not specially provided for in this section, composed wholly or in chief value of any of the feathers, flowers, leaves, or other materials or articles herein mentioned.	Do.
1909	509	Birds, stuffed, not suitable for millinery ornaments	Free.
1913	347	Feathers and downs, on the skin or otherwise, crude or not dressed, colored, or otherwise advanced or manufactured in any manner, not specially provided for in this section.	20 per cent ad valorem.
1913	347	When dressed, colored, or otherwise advanced or manufactured in any manner, and not suitable for use as millinery ornaments, including quilts of down and manufactures of down.	40 per cent ad valorem.
1913	347	Artificial or ornamental feathers suitable for use as millinery ornaments, artificial and ornamental fruits, grains, leaves, flowers, and stems, or parts thereof, of whatever material composed, not specially provided for in this section.	60 per cent ad valorem.
1913	347	Boas, boutonnieres, wreaths, and all articles not specially provided for in this section, composed wholly or in chief value of any of the feathers, flowers, leaves, or other material herein mentioned. *Provided*, That the importation of aigrettes, egret plumes or so-called osprey plumes, and the feathers, quills, heads, wings, tails, skins, or parts of skins, of wild birds, either raw or manufactured, and not for scientific or educational purposes, is hereby prohibited; but this provision shall not apply to the feathers or plumes of ostriches, or to the feathers or plumes of domestic fowls of any kind.	Do.

COURT AND TREASURY DECISIONS.

"Artificial" for tariff purposes is substantial simulation of the natural. (United States *v.* Dieckerhoff, Raffloer & Co., 4 Ct. Cust. Appls., 384, of 1913.) An exact imitation is not essential. Thus dyed straw millinery ornaments, crudely resembling "fruits, grains, leaves, flowers, and stems, or parts thereof," were held to come within paragraph 347; but articles composed of strips of colored straw and not resembling any of the things named in paragraph 347 were held dutiable as unenumerated manufactured articles under paragraph 385. (Johnson *v.* United States, 10 Ct. Cust. Appls., T. D. 38333, of 1920.) It is not necessary that the articles should truly represent fruits, grains, leaves, flowers, or stems. It is sufficient if they simulate natural fruits, leaves, flowers, and stems in physical characteristics and appearance closely enough to cause them in common understanding to be regarded as leaves, stems, flowers, or fruits produced not by nature but by the hand of man, and at the same time are appropriate and suitable to be used for those purposes of ornamentation to which the natural products may be temporarily devoted. Millinery ornaments consisting of clusters of black straw wound into the form of berries or grapes and set on black straw leaves attached to stems made of black straw and metal; and millinery ornaments consisting of sprays of black straw leaves and black straw roses sewed with black threads to a stiff fabric foundation were held properly classified as "artificial and ornamental fruits, grains, leaves, flowers, and stems"; but millinery ornaments in chief value of straw and not in imitation of fruits, grains, leaves, flowers, and stems were held dutiable as manufactures in chief value of straw in "its natural state" under paragraph 368, or if in chief value of dyed straw, as manufactures not provided for under paragraph 385. Dyed straw was furthermore held not in its "natural state" within paragraph 368, and millinery ornaments so crudely and grotesquely fashioned as to be scarcely deserving of the description ornamental and not resembling fruits, grains, leaves, flowers, and stems were held not classable under paragraph 347. (Cochran Co. *v.* United States, 10 Ct. Cust. Appls., T. D. 38336, of 1920.) Ivory brooches, pendants, and scarf-pins carved in imitation of various flowers were held dutiable as manufactures of ivory under paragraph 369, rather than as artificial and ornamental flowers under paragraph 347. (United States *v.* Darling, 10 Ct. Cust. Appls., T. D. 38334, of 1920, followed in Abstract 43739.) In another case articles of straw and chip in natural colors, too fragile and crude to be used as millinery ornaments but imported as raw material for making them, and not resembling fruits, grains, leaves, flowers, and stems, or parts thereof, were held excluded from paragraph 347, it being declared that not every bended straw or twisted shaving can amount to an artificial and ornamental flower or leaf within that paragraph. Split straw and chip material for the manufacture of millinery ornaments, too crude for classification under paragraph 347, fall within paragraph 368 as manufactures of chip and straw. (Isler *v.* United States, 10 Ct. Cust. Appls., T. D. 38339, of 1920; followed in Abstract 43745, of 1920, as to split straw in its natural condition and chip braided or twisted into shapes resembling in a crude way fruits, stems, or flowers.)

Under the act of 1913 the articles must be both artificial and ornamental. (Bayersdorfer & Co. *v.* United States, 7 Ct. Cust. Appls., 66, of 1916.) The words "artificial and ornamental" modifying the word "fruits," etc., in this paragraph refer to the per se character and not to the intended use of the articles. This is shown by the fact that feathers in various physical conditions are dutiable at one rate and "artificial or ornamental feathers suitable for use as millinery ornaments" at another rate. (Morimura Bros. *v.* United States, 8 Ct. Cust. Appls., 111, of 1917.)

Dried and dyed immortelles were held to come within paragraph 210 of the act of 1913, directly or by similitude, as preserved cut flowers and not as artificial and ornamental flowers under paragraph 347. (Bayersdorfer *v.* United States, 7 Ct. Cust. Appls., 66, of 1916; Rice *v.* United States, 10 Ct. Cust. Appls., ——, T. D. 38403, of 1920.) Wreaths of dried and dyed immortelles with straw frames, the frames being of minor value, were held by virtue of the mixed material clause in paragraph 386 of the act of 1913 dutiable at the same rate as preserved cut flowers. (Bayersdorfer *v.* United States, 7 Ct. Cust. Appls., 66.)

The following articles have been held to come within paragraph 347 of the act of 1913:

Artificial and ornamental pears and apples, chiefly used as pincushions. (Morimura *v.* United States, 8 Ct. Cust. Appls., 111, of 1917.) Goose skins dressed with down on them not suitable for millinery ornaments, as "downs on the skin * * * dressed." (United States *v.* Herskovits, 8 Ct. Cust. Appls., 203, of 1917.) Leaves and flowers for millinery ornaments made of straw which has been dyed, but the fibers of which have not been separated. (United States *v.* Gage, 8 Ct. Cust. Appls., 306; United States *v.* International Forwarding Co., id., 378; United States *v.* Rosenthal-Sloan, id., 380, of 1918.) Carved ivory flowers. (Abstract 41375, of 1917.) Artificial flowers made of beads. (United States *v.* American Bead Co., 9 Ct. Cust. Appls., ——, T. D. 38044, of 1919.) Dried skins of chicks and ducklings with the heads and feet attached, stuffed with cotton, fitted with bead eyes, and wired so as to give them a natural appearance and having a wire attachment apparently for the purpose of fastening them to other objects as decorations as "downs on the skin * * * dressed." (Morimura *v.* United States, 7 Ct. Cust. Appls., 378, of 1917.) Skins of ducklings or chicks, which skins have been dried and stuffed with cotton medicated with some preservative, same classification. (Morimura *v.* United States, 6 Ct. Cust. Appls., 183, of 1915.) Straw hats trimmed with silk, artificial flowers, and ornamental feathers, flowers and feathers predominating. (Aitken, Son & Co. *v.* United States, 6 Ct. Cust. Appls., 232, of 1915.)

Colored feathers fastened upon white cards in the shape of birds, used to decorate walls in the same manner as pictures, are articles of feathers and not feathers within this paragraph. (United States *v.* Beach, 8 Ct. Cust. Appls., 365, of 1918.) Mounted birds, not suitable for use as millinery ornaments, are dutiable at 40 per cent under this paragraph. (T. D. 36184, of 1916.) Down-filled silk quilts, silk the component material of chief value, are dutiable as manufactures of silk under paragraph 318, and not as quilts of down under this paragraph. (United States *v.* Altman & Co., 8 Ct. Cust.

Appls., 148, of 1917.) Flues of feathers, obtained by stripping one side of the goose quill, were held dutiable at 20 per cent rather than at 40 per cent under this paragraph. (United States *v.* Massee & Co., 9 Ct. Cust. Appls., ——, T. D. 38214, of 1919.)

Regulations governing the importation of plumage are contained in articles 537 and 538 of the Customs Regulations of 1915, and T. D. 33781, 33799, 33810, 33944, of 1913; 34057, 34518, 34748, 34886, 34913, of 1914; 35307, of 1915; 36322, 36382, of 1916; 37422, of 1917; and 37660, of 1918.

While downs were enumerated in the first part of this paragraph, they are not mentioned in the prohibitory clause, and downs of wild birds are accordingly permitted entry. Beaks of wild birds, however, while not mentioned, are nevertheless excluded, as being within the term "heads."

MISCELLANEOUS.

Summary of the industry.

[Abstract of the Census of Manufactures, 1914.]

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of C. R. De Long, of the Chemical Division, with relation to matches, and Sandford L. Willis, of the Metals Division, with relation to cartridges, of the Commission's staff, and of others.

FIREWORKS.

General Information.

1913 tariff paragraph.—344. Firecrackers of all kinds, 6 cents per pound; bombs, rockets, Roman candles, and fireworks of all descriptions, not specially provided for in this section, 10 cents per pound; the weight on all the foregoing to include all coverings, wrappings, and packing material.

Domestic production.—In 1914 there were 41 manufacturers, with a capital of $2,162,449 and an output valued at $2,296,236.

"Display fireworks of all kinds are the principal manufactures of establishments in this classification (fireworks); among specific products are air torpedoes, bombs, mines, set pieces, shells, wheels, torches, rockets, colored fire, lands, electric sparklers, firecrackers, paper balloons, and roman candles." [1]

Materials.—The materials most used in fireworks are gunpowder or its constituents, carbon, sulphur, and potassium nitrate. Fireworks are so varied in form that many substances may be employed in their manufacture. Metallic salts are used to produce different colors; several oxidizing materials may supplant potassium nitrate and other explosives may replace gunpowder for certain purposes. Powdered aluminum, dextrine, and copper-covered wire are used in the manufacture of sparklers. Besides their scenic purposes, rockets, Roman candles, and Bengal lights are also used for signaling at sea.

Imports and exports.—Imports by countries are not separately stated in official statistics, but practically all firecrackers imported into the United States come from China and Japan. Other fireworks were imported principally from Germany and France. Imports of bombs, rockets, etc., for the five-year period, 1910–1914, averaged 65,000 pounds, valued at $8,000, with revenue of $7,000, and those of firecrackers 3,390,000 pounds, valued at $216,000, with revenue of $254,000. Imports for the calendar year 1920 were: Bombs, rockets, etc., 14,987 pounds, valued at $4,071, with revenue of $1,499; firecrackers, 4,169,224 pounds, valued at $740,985, with revenue of $250,153.

Tariff history.—The acts of 1883 and 1894 imposed an ad valorem duty of 100 and 50 per cent, respectively, on the importation of firecrackers. A specific duty of 8 cents per pound was imposed by the acts of 1890, 1897, and 1909. The act of 1913 reduced the rate to 6 cents per pound.

Bombs, rockets, Roman candles, and fireworks were specifically provided for in the acts of 1909 and 1913. The former act imposed a duty of 12 cents per pound and the latter 10 cents per pound.

1894	323	....do	50 per cent ad valorem.
1897	420	Firecrackers of all kinds, the weight to include all coverings, wrappings, and packing material.	8 cents per pound.
1909	433	Firecrackers of all kinds	Do.
		Bombs, rockets, roman candles, and fireworks of all descriptions, not specially provided for in this section. The weight on all the foregoing to include all coverings, wrappings, and packing material.	12 cents per pound.
1913	344	Firecrackers of all kinds	6 cents per pound.
		Bombs, rockets, Roman candles, and fireworks of all descriptions, not specially provided for in this section. The weight on all the foregoing to include all coverings, wrappings, and packing materials.	10 cents per pound.

Court and Treasury Decisions.

Shells made of paper containing a charge of explosive which after importation are equipped with a fuse, a cone, powder, or other means of propelling the shells through the air, were held to be fireworks. (Abstract 41751 of 1918.) Shells containing no explosive are not fireworks. (Abstract 33162, T. D. 33660, of 1913.)

MATCHES.

[Par. 345, act of 1913.]

GENERAL INFORMATION.

Tariff act of 1913.—PAR. 345. Matches, friction or lucifer, of all descriptions, per gross of one hundred and forty-four boxes, containing not more than one hundred matches per box, 3 cents per gross; when imported otherwise than in boxes containing not more than one hundred matches each, ½ of 1 cent per one thousand matches; wax matches, fusees, wind matches, and all matches in books or folders or having a stained, tipped, or colored stick or stem, and vestas consisting of a wick coated with an inflammable substance, and night lights, 25 per centum ad valorem: *Provided*, That in accordance with section ten of "An act to provide for a tax upon white phosphorus matches, and for other purposes," approved April ninth, nineteen hundred and twelve, white phosphorus matches manufactured wholly or in part in any foreign country shall not be admitted to enter at any of the ports of the United States, and the importation thereof is hereby prohibited: *Provided further*, That nothing in this act contained shall be held to repeal or modify said act to provide for a tax upon white phosphorus matches, and for other purposes, approved April ninth, nineteen hundred and twelve.

Description.—Matches may be divided into three classes for purpose of description: (1) Friction matches, single dip; (2) friction matches, double dip; and (3) safety matches.

The first two classes will strike on any surface by friction, while the third type, or safety match, must be struck on the side of the box which has been prepared with a mixture of phosphorus sesquisulphide and some abrasive material. In the single-dip match the necessary materials are all mixed together and put on in one dipping; in the double-dip matches the first coat contains an oxidizing agent, such as potassium chlorate, glue, and an inert filler, such as clay. The second dip, or tip of the match, contains the highly inflammable substance, such as phosphorus sesquisulphide, and an abrasive material, such as flint or ground glass. The double-dip match is probably used more in the United States than any other kind of match. The advantage of this match is that it prevents the dangerous dead- and is safer from fire hazard and for transportation.

Materials.—The ordinary match is composed of a mixture of the four following classes of materials: (1) An easily inflammable material, such as phosphorus sesquisulphide or antimony sulphide; (2) an oxidizing agent, such as potassium or sodium chlorate, red lead, or manganese dioxide; (3) inert materials, as an abrasive, such as ground glass or flint, and coloring matters; (4) glue or some adhesive gum for the purpose of causing the head to adhere to the stick and to exclude the air from the head of the match.

The match stick is usually impregnated with paraffin wax to make it ignite readily, and in recent years it has become the practice to also impregnate the stick with some chemical, usually sodium phosphate. The wood used for match stems in the United States is usually that of the white pine, while in European and Asiatic countries, the Russian aspen is used.

Method of manufacture.—The manufacture of matches has been developed to the point where it is a continuous mechanical operation requiring comparatively little labor. The perfectly dried blocks of wood are cut into lengths of 2⅜ inches and are then fed into automatic cutting machines. These machines cut about 40 match splints at one stroke and these are forced automatically into openings in a perforated iron plate which is in continuous movement. The match splints after being forced into the plate are conveyed over a series of heaters and then through an arrangement which forces out any imperfect splints. The plates now pass over a trough of paraffin wax in such a manner that about one-fourth of the stick becomes impregnated. The matches now pass over a composition roller where the first dip is put on. In order that the first dip may have time to dry, the plates are made to travel up and down through a series of wheels and are then given a second dip. The finished match is now carried back toward the end where the blocks were first punched. Sufficient time elapses for the matches to dry. Here, the matches are automatically punched out from the traveling belt and automatically packed in boxes of the desired number.

According to Rogers,[1] the machine used for the double-dip matches is 96 feet long, contains 1,600 plates, takes one hour for the complete operation, and makes 8,000,000 matches in 10 hours.

The manufacture of matches requires careful control of atmospheric conditions. The air in the match-making room is usually purified and kept within fixed limits of temperature and humidity. This is necessary for the proper dipping and drying of the matches. Also this careful control makes a more desirable atmosphere for the workmen necessary to operate the machines.

Output.—According to the 1914 census there were 20 establishments engaged in the manufacture of matches, employing 3,800 wage earners, with a capital of $11,736,187 and an output of matches valued at $12,500,000. It is estimated that the production in the United States in 1917 amounted to 28,805,000 gross boxes of matches.

Domestic export.—Prior to 1915 the domestic export of matches was between $80,000 and $100,000. About 50 per cent of the export was to Canada. During the period from 1915 to 1918, inclusive, the domestic export of matches was fairly constant at between $430,000 and $500,000. During this period France was the principal consumer. During the 1919 calendar year exports increased to $626,780, and in 1920 amounted to $514,592.

Laws relating to the match industry.—Formerly matches made in the United States contained ordinary white or yellow phosphorus. The constant handling of this material in match factories by workmen led to the so-called "phosy jaw." The passage of the Esch-Hughes Act in 1912 prohibited the importation of white phosphorus

COURT AND TREASURY DECISIONS.

The provision for "friction or lucifer matches of all descriptions," in the act of 1883 was held to include so-called safety matches. (Dept. Order, T. D. 5900.) Customs officers were instructed to have an actual examination of matches in their packages made by examiners at importers' stores instead of on the wharf. (Dept. Order, T. D. 6081.)

An article known as five-minute candle matches, about 3 inches long and one-fifth of an inch in diameter, consisting of a cotton wick or core covered with wax, the tip of which was coated with a preparation whereby the article could be ignited by friction, was held dutiable as matches and not as a manufacture of wax under the act of 1890. (G. A. 2178, T. D. 14214.)

A wax-coated cotton paper or ribbon, having attached thereto at regular intervals of about 1 inch a preparation similar to that contained on friction matches by means of which the taper or wick was ignited, was held dutiable as friction matches and not as a manufacture of wax under the act of 1890. (G. A. 2187, T. D. 14223.)

Under the act of 1909 (par. 436), the first to impose duty on fancy matches eo nomine, matches made of thin flat sticks, tipped with some ignitible composition colored, made up in pairs and pasted to a paper folder or wrapper in such a way that they may be conveniently carried in the vest pocket and the splints readily borken off one at a time as required, were declared to have no quality not found in the ordinary safety match of trade and to have the same common use, and, in the absence of a commercial designation, were held dutiable at three-fourths cent per thousand. (United Cigar Stores Co. *v.* U. S., 4 Ct. Cust. Appls., 66, T. D. 33311, reversing Abstract 28911, T. D. 32645; Abstract 28971, T. D. 32655; and Abstract 29212, T. D. 32681.)

Safety matches with colored sticks were likewise classified, but flamers or wind matches were held dutiable as fancy matches under that act. (U. S. *v.* Masson, 5 Ct. Cust. Appls., 77, T. D. 34103, modifying Abstract 33553, T. D. 33738.)

Safety matches, colored or uncolored or with varigated, varicolored stems, were held dutiable under paragraph 436 of the act of 1909 at the rate of 6 cents per gross boxes, or three-fourths cent per thousand, depending upon whether they were imported in boxes or otherwise than in boxes. (Dept. Order, T. D. 33633; Abstract 32588, T. D. 33511.)

Friction matches with stained sticks were held properly classified at 25 per cent ad valorem under paragraph 345 of the act of 1913. (Abstract 36768, T. D. 34871.)

Matches having red sticks or stems, imported in boxes containing less than 100 each, were held dutiable at 25 per cent ad valorem under paragraph 345 of the act of 1913 as matches having colored sticks or stems and not at 3 cents per gross under the provision for friction or lucifer matches of all descriptions. (G. A. 7669, T. D. 35097; Abstract 36768, T. D. 34871; Abstract 40377, T. D. 36509.)

Night lights, articles like candles but very short and very thick, which were not specifically provided for prior to 1913, were classified

under the act of 1909 as articles in part of metal when resting on a metal base, as nonenumerated manufactured articles when in part of metal or as manufactures of wax when in chief value of paraffin. (United States *v.* Borgfeldt, 3 Ct. Cust. Appls., 408; United States *v.* American Import Co., 3 Ct. Cust. Appls., 361; United States *v.* Park, 3 Ct. Cust. Appls., 350; United States *v.* Godilot, 3 Ct. Cust. Appls., 128; United States *v.* Coccaro, 4 Ct. Cust. Appls., 506; followed in Abstract 41763 as to candles in chief value of paraffin, 7 inches long, of different colors, each having a small wick in the center, and classified as tapers.)

Candles are not included among the lighting articles in paragraph 345 of the act of 1913.

Sanctuary lights consisting severally of a china base or stand, a wire implement, and a quantity of wicks composed of a bamboo core covered with braided cotton and coated with wax or paraffin, cotton being the component material of chief value, were held not to be tapers within paragraph 436 of the act of 1909, but were held dutiable under paragraph 332 as manufactures of cotton, wax, and wood, cotton chief value. (G. A. 7422, T. D. 33119, of 1913.)

CARTRIDGES, LOADED AND EMPTY, PERCUSSION CAPS.

SUMMARY.

Cartridges or charged shells embrace complete loads for modern breech-loading firearms. They consist in general of a metal or metal and paper casing filled with gunpowder. They contain in one end a percussion cap or primer for detonating the charge and in the other end a close-fitting lead or composition metal bullet or a measured amount of shot. Primers are shallow metal cups carrying a small amount of fulminate of mercury or other detonator.

The domestic manufacturing industry is highly organized and efficient and in normal times enjoys a substantial foreign trade in addition to supplying the domestic demand. The manufacturing process is largely automatic and is carried on in a small number of plants located in New England and in Ohio and Illinois. The strength of the domestic manufacturers' position is due in part to the large domestic demand for sporting purposes and in part to the prestige of the domestic firearms.

Exports before the war amounted to between $2,500,000 and $3,000,000 yearly. The available statistics mention only loaded cartridges (metallic), but domestic manufacturers state that paper shells and percussion caps amount to only 5 per cent of their export business.

Imports in normal prewar times seldom amounted to over $70,000 per annum. They are largely supplementary to the domestic production and include besides a small amount of ammunition as compared with the domestic product—ammunition for foreign sporting arms which are sold in small numbers in the United States, ammunition for obsolete European army rifles sold in the United States at a sacrifice, and a small number of empty shells sold to small ammunition-loading companies producing special loads not sold by the large producers.

The ammunition industry is of great importance in times of military crises. If the Nation is to be prepared for an emergency, some domestic plants must be maintained on a highly efficient plane. Large immediate production and elasticity as to output are required. European nations, not having the considerable nonmilitary domestic consumption necessary, stimulate their industries by supplying small nations with their military supplies and in some cases by subsidizing with money grants to insure the desired flexibility on short notice.

Percussion caps were dutiable at 40 per cent ad valorem under the acts of 1883 and 1890; 30 per cent ad valorem under the acts of 1894, 1897, and 1909; and 15 per cent ad valorem under the act of 1913. Cartridges were dutiable at 35, 30, and 15 per cent, respectively, under the acts of 1897, 1909, and 1913.

Due to the lower price of the metal abroad, domestic manufacturers are at some disadvantage in buying lead, an important item of expense in the manufacture of cartridges.

The tariff paragraph might be expanded to include primers. Percussion caps, in the trade, are confined to caps for use with muzzle-loading firearms, a practically obsolete weapon. Primers perform the same service (detonation of the charge) in the self-contained ammunition.

Summary table—Values—Cartridges.

[illegible] year.

General Information.

[illegible] Par. 348. Percussion caps, cartridges, and cartridge shells empty, 15 per cent ad valorem.

Description.

[illegible] are three types of cartridges in common use, namely, centre-fire metallic, rim-fire metallic, and shot-gun. Shot shells

Centre-fire metallic cartridges consist of a brass drawn case, headed and primed to receive the firing of ignition. The case contains a propellant in the nature of black or smokeless powder and a bullet in the front end. Centre-fire cartridges are used for all calibers except the common low-power rifle.

Rim-fire cartridges consist of a rolling head copper drawn cup, closed or headed at the closed end. The head of the case is filled with an explosive of priming mixture (potassium chlorate and fulminate of mercury). The shot contains a powder charge of black or smokeless powder and the lead bullet is inserted in the open end. Rim-fire shells are seldom used for calibers above .[illegible] .25 and .28.

Cartridge paper shot shells consist of a [illegible] tube of heavy fiber over one end of which is crimped a [illegible] The [illegible] is filled with [illegible] The [illegible] charge of [illegible] is placed in the shell and [illegible] with several [illegible] The [illegible] is [illegible] [illegible] The [illegible] is filled [illegible] The [illegible] is [illegible] [illegible] to [illegible] by [illegible]

Empty cartridges and shells are covered by the description of cartridges, the only difference being that they do not contain the propellant charge and bullet or shot.

Percussion caps and primers are shallow cups of gilding metal filled with fulminate or other igniting mixture. They are carefully sized to fit into the socket in the head of metal or paper shells or over the cap nipple of muzzle-loading weapons. Percussion caps are used to detonate the charge in muzzle-loading arms and primers are inserted in a pierced socket in the end of the cartridge.

Rifle cartridges are sized by the rifle bore the bullet fits. The bore is figured in hundredths of an inch and the cartridge is named the same way. Thus a 32-caliber shell contains a bullet to fit a rifle the bore of which is thirty-two one-hundredths of an inch in diameter. Large and special caliber cartridges are often given two or even three numbers and may be further classified by the name of a manufacturer or a trade name. In such cases the first number indicates the caliber, the second indicates the charge of black powder or smokeless powder equivalent in grains, and the third the weight of the bullet in grains. The trade name usually refers to the pattern of rifle for which the cartridge is designed. Thus a 45–70–405 Government cartridge is one containing a bullet weighing 405 grains to fit a 45 caliber rifle, Government model, and propelled by 70 grains of black powder.

The paper shot shells are used exclusively in shotguns. Shotguns are classified by a unit of bore diameter, known as the gauge, the origin of which is lost in antiquity. The most plausible explanation is that the gauge number is a measure of the number of lead balls of that diameter which can be cast from a pound of metal.

USES.

The material enumerated above is used in firearms for hunting and sporting purposes. The military importance of small arms—rifle and revolver—ammunition is self-evident.

DOMESTIC PRODUCTION.

Domestic firearms manufacturers were the pioneers in the development of cartridges. Repeating rifles, revolvers, and shotguns for sporting use were first developed in the United States and the growing popularity of this class of arm created an enormous demand for suitable ammunition. In 1914 returns from 32 companies showed a total capital investment in the industry of $37,454,000 and a yearly output valued at $30,840,000. An additional $3,101,645 was reported from concerns manufacturing other lines of goods.

The war caused a very large expansion in the industry and no approximation of the present capitalization is available (1920).

Raw materials.—The more important raw materials include copper and brass sheets, and paraffin-treated paper tubes for casings; lead, antimony, and cupro-nickel for bullets; and powder and fulminate of mercury for use, respectively, as propellant and detonator. The other requisites, many of which are components of the major items, are lead sulphocyanide, cornstarch, collodion, T. N. T., barium nitrate, potassium chlorate, antimony sulphide, shellac, gum arabic, glue, tin, wax, tallow, sulphur, and powdered aluminum. Most of the chemicals mentioned are used in the manufacture of gunpowder.

Crude nitrate is imported from Chile, nickel from Canada, and shellac and gum arabic from the East Indies and Central America. The balance of the raw materials are largely from domestic sources.

Equipment.—The automatic machines used in the munition plants of the United States are entirely of domestic manufacture, and as they were largely developed in this country, the domestic plants probably have an advantage over the foreign manufacturers in this respect.

Methods of production.—The manufacturing processes as operated in the United States are highly automatic. The shells are formed, primed, and filled entirely by automatic machines, which feed themselves and turn out a finished product. The exacting requirements of repeating and automatic firearms mechanism, together with the heavy strains that the shell is under at the moment of explosion, make exact sizing and careful annealing necessary. These points are carefully controlled in domestic plants. Foreign plants prior to the war used a large amount of hand-fed machinery, but it is probable that war developments have largely eliminated the less efficient types.

Organization.—The efficient conduct of the industry requires large plants, large capital investment, highly developed organization, and a wide market. In the United States most of the important cartridge manufacturers are also producers of firearms. This arrangement is of value to the consumer because cartridges are manufactured to fit every model of firearm as soon as it is put on the market.

Geographical distribution.—The manufacturing industry is highly centralized, 95 per cent of the production originating in five cities—New Haven and Bridgeport, Conn.; Lowell, Mass.; East Alton, Ill.; and Kings Mills, Ohio. From a military standpoint eastern cities are perhaps more liable to attack than are those in the Mississippi Valley.

History of the industry.—Self-contained ammunition first came into common use about 1850, when the mechanism of breech-loading firearms was perfected. The first shells were rim fire, but center-fire cartridges soon came into favor owing to demand for a cartridge which could be reloaded. In recent years improvements in gunpowder and detonator manufacture have greatly increased the efficiency of the cartridges in which the new products are used.

Domestic production and consumption.—According to the census statistics, the value of ammunition manufactured in the United States in 1914 was $30,840,000, which probably is a fair average of the yearly production before the war. Imports amounted to less than $100,000 in value, but exports totaled well over $3,500,000. The excess of producing capacity over domestic consumption is now more pronounced, due to the enormous expansion during the war, when all the allied Governments were supplied with ammunition of domestic manufacture.

Domestic exports.—Domestic manufacturers of cartridges have built up a substantial foreign trade in all parts of the world, but especially in undeveloped regions, such as Canada, Mexico, South America, Africa, and Australia. There they compete with the products of Great Britain, France, Germany, Belgium, and Canada, but are able to hold their own largely because of the fact that domestic makes of firearms are widely and favorably known in all foreign markets and the use of ammunition made especially for any particular arm follows

as a matter of course. In 1914 the exports included loaded cartridges valued at $3,521,533. This item did not cover either empty shells or percussion caps. A large manufacturer of ammunition reports that its exports consist of loaded cartridges (metallic) about 95 per cent; loaded paper shotgun shells, 4.5 per cent; empty paper shells, 0.3 per cent; and percussion caps, 0.2 per cent. War exports in 1917 were over $65,000,000. Under the circumstances, this is chiefly significant as showing the productive capacity of the domestic industry.

FOREIGN PRODUCTION.

All important European nations recognize the importance of the ammunition-manufacturing industry to the military program, but the test of the World War proved that Germany was the only power which was prepared to supply the required military supplies on short notice. The European nations are so thickly settled that, in general, hunting as a sport is restricted to the wealthy. On this account the home consumption of cartridges for other than military use is small. Those nations which normally supported a large standing army consumed a large amount of ammunition in target practice, but the quantity produced for home consumption was totally inadequate even for a limited military campaign. Germany alone among the large powers took measures to supplement in case of necessity the normal production. German arms manufacturers spent much time and large amounts of money to introduce their products abroad and secure their acceptance and use by the military authorities of the minor powers. This resulted in an enlarged production, and elasticity was assured by subsidizing other industries on condition that the plants be so constructed as to be capable of quick conversion to military uses in time of war.

IMPORTS.

Imports may be divided into four classes, viz: Ammunition for foreign high-power rifles, which are imported in small quantity; ammunition to fit old models of European army rifles; empty shells consigned to small ammunition loaders making a specialty of filling small orders of special loads not obtainable from regular manufacturers; and loaded ammunition to fit domestic firearms.

The market for foreign firearms ammunition in the United States is very limited. Usually the domestic manufacturers make no attempt to supply the special cartridges which must be used.

The United States has been the clearing house for obsolete army equipment from all over the world, and in this way large numbers of military rifles are obtained for domestic consumption at a very small price. Large quantities of ammunition are usually obtained with the arms, and are sold to buyers of the latter. The demand for this class of ammunition is temporary, and imports seldom extend beyond the initial shipment.

Domestic ammunition manufacturers have restricted their production to a small number of standard loads. This practice created a limited demand for special loads, of shotgun shells especially, and manufacturers specializing in this trade claim that domestic manu-

facturers of empty shells would not sell at a figure which would permit a profit on the loading operation.[1] The restricted supply of ammunition available for sporting use during the war years forced the public to depend solely upon factory loads, and as these gave satisfaction in most cases, the demand for abnormal or special loads has greatly decreased.

One Canadian manufacturer sold a considerable quantity of small-arms ammunition in the United States. It was confined largely to the popular 22-caliber size and found very little market outside of New England. Other imports of this nature are negligible.

Importations of cartridges, both loaded and empty, were valued at about $70,000, $72,000, $67,000, and $63,000, respectively, during the fiscal years 1910, 1911, 1912, and 1913. In 1914 imports increased to $84,622, of which $73,554 worth was imported after the passage of the tariff act of 1913. Imports decreased during the early war years, but increased to over $800,000 in value during 1917. In the same year the value of exports with the benefit of drawback amounted to $683,720. It is probable, therefore, that the imports in question were mainly special shells imported from the allied countries for loading in the United States.

Importations of percussion caps during the fiscal years since 1907 never exceeded $2,900 per annum, and during the four years 1911 to 1914, inclusive, the maximum yearly importation was only $621. The importations were probably composed in large part of primers.

PRICES.

Prices have increased about 100 per cent during the period 1914 to 1920. The increase in some instances was greater for large caliber metallic cartridges than for paper shells, because every available machine suitable for manufacturing the 30-caliber Army ammunition was requisitioned for that purpose.

The rim-fire 22-caliber ammunition is sold at a relatively lower price than is asked for that of larger calibers. This, no doubt, is due in part to the competition offered by the Canadian plant mentioned above. However, a more important reason is that the enormous popularity of this shell for target use permits manufacturers to produce it in very large quantities, obtaining the advantage of large-scale production with the accompanying reduction of overhead charges.

MILITARY IMPORTANCE OF THE INDUSTRY.

The essential nature of the ammunition manufacturing industry from a military viewpoint is apparent. It is of first importance that the domestic industry be efficiently organized and capable of considerable expansion at short notice in order that the military forces of the Nation may be adequately supplied.

The industry in the United States is the equal of those of European powers, not excepting Germany. The large normal consumption of the product in the United States for sporting purposes tends to assure the industry a substantial and continuing domestic market.

---

[1] Tariff hearings, 1913, Comm. W. and M., p. 5307, brief of American Ammunition Co.

TARIFF HISTORY.

Percussion caps have been specially provided for in the tariff acts of 1883, 1890, 1894, 1897, 1909, and 1913, at 40, 40, 30, 30, 30, and 15 per cent, respectively.

Cartridges were not specially provided for prior to 1897. In that year the duty was placed at 35 per cent. The rate was reduced to 30 per cent in the act of 1909, and further reduced to 15 per cent in the act of 1913.

COMPETITIVE CONDITIONS.

Domestic brands of ammunition are favorably known throughout the United States and in fact in all countries. Popularity of ammunition in most cases, especially in foreign markets, follows popularity of firearms. In addition, certain domestic manufacturers, who do not manufacture firearms, have built up a large domestic demand for their ammunition. The manufacturer of both arms and ammunition possesses an advantage in that both products may be advertised and sold by a single organization for about the cost of handling either line separately. This factor materially reduces the cost of advertising and sale without impairing the efficiency of the service. In fact, the prestige enjoyed by firearms is highly advantageous in the sale of ammunition because the manufacturer in many cases will not guarantee the performance of either unless both products are used together.

TARIFF CONSIDERATIONS.

Specific duties are impracticable in dealing with cartridges and percussion caps because of the large variety of sizes and kinds in common use.

Lead constitutes an important part of the value of the finished product. This metal, when imported, is subject to a duty of 25 per cent ad valorem and generally sells at a higher price in the United States than in Europe.

Domestic cartridges are subjected to a duty of 30 per cent in Australia and 37½ per cent in Canada. The Great Britain preferential rate to those countries is but 15 per cent.

The words "percussion cap" as used in the trade refer only to the detonators used with muzzle-loading firearms. This article, although used to some extent in other countries, is practically obsolete in the United States. The trade name for the inserted detonator of cartridge ammunition is "primer." To avoid confusion, both percussion caps and primers should be specified.

Rates of duty—Cartridges, loaded and empty—Percussion caps.

Act of—	Par.	Tariff classification or description.	Rates of duty, specific and ad valorem.
1883	474	Percussion caps	40 per cent ad valorem.
1890	442	do	Do.
1894	327	do	30 per cent ad valorem.
1897	424	do	Do.
		Cartridges	35 per cent ad valorem.
1909	437	Percussion caps, cartridges, and cartridge shells, empty	30 per cent ad valorem.
1913	346	do	15 per cent ad valorem.

Court and Treasury Decisions.

Detonators are not percussion caps. (G. A. 2291, T. D. 14407, of 1893; G. A. 2342, T. D. 14550, of 1893.)

Paragraph 424 of the act of 1897 was construed to cover cartridges for miniature guns and pistols. (G. A. 5467, T. D. 24768, of 1903.)

BLASTING CAPS.

General Information.

Act of 1913.—Par. 346. * * * blasting caps, $1 per thousand.

DESCRIPTION.

Blasting caps as sold in the United States consist essentially of a measured charge of high explosive pressed into a thin copper shell. The shell is approximately ¼ inch in diameter and of varying lengths, depending on the density of the explosive used in the cap and also on the quantity. Ordinarily, fulminate of mercury is the explosive used, but sometimes other explosives are used in combination with it. The fulminate is pressed in the shell at such a pressure and in such a way that it will not readily come loose in transportation and yet so that it is not pressed too tight so as to fail of ignition when exposed to spark or open flame.

There are two grades commonly sold, commercially known as the No. 6 and the No. 8 caps. The No. 6 cap contains 1 gram of fulminate of mercury, or its equivalent, and the No. 8 cap contains 2 grams, or its equivalent.

Caps are used in connection with fuse to detonate the various high explosives used for commercial purposes, especially in the blasting of coal, ores, and in quarry operations.

The blasting cap is of the greatest commercial importance since it is the only practical and economical means which we have of properly detonating the high explosives necessary to blast coal and the various ores. At the present time, rock for such industries as road building, cement making, etc., are mined by the use of explosives together with the various ores, such as iron, gold, etc., and coal. The quantities of these materials obtained without the use of explosives are negligible, and there are no methods developed to date which could be used in place of the explosive method. In land-clearing operations, drainage propositions, tree planting, etc., dynamite is used to a very large extent and the quantity used for such propositions is increasing every day. Dynamite would be useless in all instances without the blasting cap.

In addition to the blasting cap, there is manufactured an electric blasting cap which is basicly very similar in construction. An arrangement is provided for obtaining ignition by passing an electric current through two wires which are inserted in the shell and which are connected at their terminals by means of a very fine wire which the current renders incandescent.

In coal-mining operations especially, such a cap is much the safer as the ignition can be obtained without bringing an open light into gaseous and dusty areas. Open lights may be dangerous in coal mining due to the possibility of explosive gases being present. Some

mining companies accordingly insist on the electric blasting cap. For certain metal-mining operations where it is necessary that a number of shots be fired at one time, the electric blasting cap is the best means of accomplishing this purpose.

Due to the complicated construction of electric blasting caps, the cost and extra labor for such a cap with 6-foot lead wires is approximately five times as great as for straight blasting caps. The cost of the fuse used with the ordinary caps brings the value up to a more comparable basis.

DOMESTIC PRODUCTION.

The consumption of blasting caps or electric blasting caps in the United States is approximately 250,000,000 caps per year, and the manufacturing capacity approximately 515,000,000, or more than twice the consumption.[1]

Blasting caps or electric blasting caps are essential where every kind of high explosives are used.

The principal industries using blasting caps or electric blasting caps are metal mining, coal mining, railroad construction, quarrying, and agricultural purposes.

Materials.—The principal materials used in manufacture are copper gilding metal, nitric acid, ethyl alcohol, chlorate of potash, and quicksilver. The nitric acid comprises essentially sulphur and nitrate of soda.

Gilding.—The manufacture of this material is not dependent on foreign sources. It is made of a combination of copper and spelter, both of which are produced in this country. Prior to the war the crucibles that were used in melting were imported from Germany, but now a satisfactory grade is being made here.

Nitric acid.—The chief ingredient in nitric acid is nitrate of soda, which is imported from Chile. There are ample manufacturing facilities in this country once the nitrate of soda has been imported.

Ethyl alcohol.—There is ample manufacturing capacity in this country, the chief raw material being imported from Cuba and Porto Rico. The largest percentage of the manufacturing capacity in this country is designed for the use of imported molasses, and if this supply were eliminated manufacturers would have to use grain, adding to the cost of manufacturing.

Chlorate of potash.—The basic raw material (potash) is imported from Alsace-Lorraine and Germany. Present tariff permits free importation.

Quicksilver.—Quicksilver is produced in the western part of the United States, but this country imports considerable quantities from Spain, Portugal, Italy, and Mexico to supplement domestic production. There is a duty of 10 per cent now on quicksilver. The manufactured fulminate is now on the free list.

Equipment.—The equipment and machinery used in the manufacture of blasting caps is produced in the United States. There is one exception, the glass balloons used in the manufacture of fulminate of mercury, the principal explosive ingredient in blasting caps. These balloons were obtained from Jena, Germany, but at the outbreak of the war foreign shipments ceased, and domestic sources of supply had to be developed. Due to the treatment which these bal-

[1] Statement from the largest manufacturer.

looms receive in the process of manufacturing fulminate of mercury, they had to be specially developed and designed. Cap manufacturers claim that they have not been able to obtain the quality of product previously received from Germany. Several domestic manufacturers have tried to make these balloons with varying degrees of success.

Most of the other machinery and equipment used in the actual production of blasting caps is of special design and construction, developed by years of careful study, investigation, and practical experience. The machine-shop equipment, of course, is of standard American manufacture.

Methods of production.—The production of blasting caps requires three departments—the shell-drawing, fulminate manufacturing, and cap-loading divisions.

The shell-drawing division is one in which the copper tubes used in the manufacture of blasting caps are made. Specially designed and tooled machines take copper gilding metal of various specified widths and thicknesses, and by means of automatic and semiautomatic drawing machines bring this copper gilding metal to the form of a one-piece copper tube, open at one end of approximately 0.221 inch diameter, in lengths from 1 to 3 inches, inclusive, having walls 0.007 inch in thickness. The operation of manufacturing these shells is necessarily very delicate and requires the most exacting care and close attention to details.

The fulminate division manufactures fulminate of mercury from quicksilver, nitric acid, and ethyl alcohol. Quicksilver and nitric acid are placed, according to a specific formula, in a small dissolving flask; after being allowed to stand for a specified time, are brought to the fulminate plant, placed in a glass balloon containing a specific quantity of ethyl alcohol. A violent reaction is set up, at the end of which the residue left in the balloon is crystalized into fulminate of mercury. The fumes from the reaction are sucked into a very complicated recovery system, and after a series of condensations and neutralizations, alcohol and quicksilver are recovered from them.

The fulminate after being manufactured is stored under water and when required for use is thoroughly dried in dry houses built for that purpose, and brought to the mixing houses, where it is incorporated with chlorate of potash, the other essential ingredient in the blasting cap explosive mixture, and is then brought down to the cap-loading department, which loads the mixture into the shells which have been received from the shell plant.

The fulminate of mercury manufactured and used in this business is the most highly sensitive commercial explosive manufactured at the present time. So many special safety features and fire-protection features are necessary to reduce hazards to a minimum.

Organization.—The special and peculiar nature of the product requires a carefully trained and highly developed organization, both technical and practical, to successfully and safely carry on the manufacturing operation. A large amount of capital is required to carry on this business. At the present time the du Pont Co. states it has $4,056,000 invested in the blasting cap and electric blasting caps business, which would at present replacement values amount to 20 per cent more. There are a great many buildings required in the manufacturing operation because of the hazardous nature of

the material handled, which required limits as to the amount of explosives material that can be carried in any one building and specified distances between buildings and artificial and expensive barricades around the buildings in which the explosives materials are carried and handled. Other manufacturers engaged in the industry within the United States are Atlas Powder Co., of Wilmington, Del.; Aetna Explosive Co., of New York City; California Cap Co., of Oakland, Calif.

The plants are not adapted to the manufacture of other material. None of the machinery, except the generators, is adapted for the manufacture of other materials, and neither are the plants logically situated except for the manufacture of caps and electric blasting caps or some similar product.

Geographical distribution.—The principal manufacturing plants are located in the States of New Jersey, New York, Pennsylvania, and California, the largest in New Jersey. Many distributing magazines are maintained throughout the United States and Alaska in which stocks are carried in order to give prompt and economical service to the trade.

Domestic production and consumption.—The annual consumption of blasting caps and electric blasting caps amounts to 250,000,000 per year, with an approximate gross value of $6,000,000.

Domestic exports.—The following statement of the du Pont Co. indicates its domestic and export sales for the periods named:

	Domestic sales.	Export sales.	Grand total.	Per cent export.
1914	138,096,262	8,251,200	146,347,462	5½
1915	136,437,423	119,217,371	255,654,794	46½
1916	142,595,314	128,698,600	271,293,914	47
1917	150,603,233	78,940,100	299,543,333	34
1918	111,160,849	66,750,550	177,911,399	37½
1919	71,495,686	22,310,200	93,805,886	23½
1920 (6 months)	56,697,073	10,144,073	66,841,146	15

The du Pont Co. states: "It will be noted that our export sales for 1914, which was a normal year and may be taken as a criterion of what we may expect in the way of exports in normal times, was 5½ per cent of the total as against 34 to 47 per cent during the war period. It is true that we have had a larger percentage of export business since the war than we enjoyed before the war, but we believe that this is due to foreign manufacture (Germany and Austria) not having as yet become rehabilitated, and just as soon as they do our percentage of export trade will recede to the normal before the war, the percentage having already declined from 23½ per cent in 1919 to 15 per cent for the first six months of 1920."

During the war domestic manufacturers exported to most foreign countries except the Central Powers, the bulk of the shipments going to Africa, China, Japan, Italy, Spain, Norway, Sweden, Russia, Wales, and South America, whereas in normal times the bulk of our export shipments go to Mexico and South America and to American mining operations using American explosives.

The principal competing nations at the present time are Austria, Belgium, Germany, England, and Japan.

FOREIGN PRODUCTION.

All domestic manufacture of caps and electric blasting caps follows pretty closely one standard formula, but claims are made that the quality of foreign product is variable. Blasting caps are not sold by weight. Therefore it is difficult for a layman to determine whether the weight of the charge or kind of composition used conforms to standard because of the danger in extracting the charge from the shell for analysis.

Belgium, Germany, Austria, and Japan are the principal producing nations that have potential power as American competitors. The industry in these countries is either controlled by highly organized syndicates or subsidized by the Government. Each of these countries offer a sufficient volume of business in their own domain to make production economical. They also have the advantage of lower labor cost.

IMPORTS.

Foreign competition is not serious and America has heretofore only been considered by foreign producers as a market for surplus stocks, and foreign producers have apparently not as yet sufficiently recovered from the effects of the war to accumulate very large surplus, but quotations have recently been received at prices materially lower than domestic quotations.

Importations have always been sporadic. There are no disadvantages of transportation, geographic, or other conditions to induce domestic consumers to seek foreign products.

There are no substitutes that can compete with blasting caps, but there are some cheap explosive ingredients which may be used as a substitute for standard ingredients for loading caps. This might dangerously affect blasting operations at the hands of consumers.

The Du Pont Co. reports recent quotations from the Belgium Powder Syndicate offering No. 6 blasting caps at 140 francs ($12 per 1,000) f. o. b. Antwerp, which is equivalent to $13.10 per 1,000 f. o. b. New York, including freight and duties, the freight being approximately 10 cents and duty $1 per 1,000, as against present domestic wholesale price of $15.32, a difference of $2.22. Quotations have also been received from England at 65 shillings per 1,000 for No. 6 blasting caps f. o. b. English ports and from Japan at 18 yen per 1,000 f. o. b. Japanese ports.

PRICES.

Owing to fluctuation in material costs and labor costs during the war, prices are still unstable. Comparison of wholesale prices at home and abroad as they prevailed in 1913 seems more significant of general conditions.

The following table shows a comparison of prices compiled in 1912:[1]

[1] Statistics compiled by the Du Pont Co.

Grade cap.	German prices f. o. b. Hamburg.		American prices f. o. b. New York.
	For use in United States.	For use in Germany.	For use in United States.
No. 3	Mks. 8.25-$1.96	$3.47	$4.50
No. 4	10.00- 2.38	4.40	4.89
No. 5	11.50- 2.74	4.77	5.35
No. 6	15.00- 3.57	5.95	6.39

Comparison of 1913 wholesale prices (domestic and foreign):

Grades.	Weight.	Germany to United States.	United States.	Canada.
	Gms.			*Per 1,000.*
No. 3	550	$3.57	$4.55	$5.65
No. 4	650	4.05	5.00	6.00
No. 5	800	4.88	5.45	6.80
No. 6	1,000	5.95	6.38	7.60
No. 7	1,500	8.21	8.25	9.30

Prices in column 3 (Germany) are from reports of American Consul General Skinner at Hamburg, dated February 27, 1913, and published in Daily Consular Report of April 16, 1913.

TARIFF HISTORY.

The tariff act of 1894 provided a specific duty of $2.07 per 1,000 caps, which was raised to $2.36 in 1897. With this increase in duty, Germany continued to export to this country on an average of 4,500,000 per year, or approximately 15 per cent of the domestic consumption at that time. Domestic manufacturers claim that the foreign producers quoted prices very much lower (sometimes as much as 40 per cent lower) than prices at which they were sold to the consuming trade in their own country. (See price quotation on p. 34.)

The tariff act of 1909 set the duty at $2.25 per 1,000, and the act of 1913 at $1 per 1,000.

COMPETITIVE CONDITIONS.

The American producer has the advantage of having domestically available practically all raw materials, and also of being closer to consumption destinations. The disadvantages are cheaper foreign labor and raw materials, highly organized syndicated control abroad, permitting favorable export marketing. These foreign syndicates also extend long credits in order to induce trade.

The condition of the industry at present is that only half of its productive capacities of domestic manufacturers is being used on account of domestic consumption having fallen off after the war, and also to loss of export business through foreign competition.

TARIFF CONSIDERATIONS.

Blasting caps are universally designated by grades numbered 3 to 8, each supposed to have a given weight of explosive composition, the lowest number having the least weight. The grade most used in America is No. 6, and domestic producers claim that it is quite common practice for foreigners to put a No. 6 label on a No. 5 grade for sale at lower prices in the American market as a standard No. 6 grade. The Bureau of Mines published circulars cautioning miners not to use anything weaker than the No. 6 grade blasting cap or electric blasting cap. A proviso requiring all manufacturers of blasting caps to number according to the accepted domestic standard, or to state the strength or equivalent weight of fulminate used, would safeguard domestic consumers against all understrength material.

Blasting caps.

Act of—	Par.	Tariff classification or description.	Rates of duty, specific and ad valorem.
1894	327	* * * blasting caps	$2.07 per 1,000 caps.
1897	424	do	$2.36 per 1,000 caps.
1909	437	do	$2.25 per 1,000 caps.
1913	346	do	$1 per 1,000 caps.

COURT AND TREASURY DECISIONS.

Blasting caps or detonators composed of fulminate and copper, fulminate chief value, were held dutiable as manufactures of copper and not as fulminate under the act of 1890. (G. A. 2684, T. D. 15158.)

JOSS STICK.

General Information.

1913 tariff paragraph 521.—Joss stick or joss light. Free.

DESCRIPTION AND USES.

Joss sticks are reeds covered with paste made from the dust of odoriferous woods or cylinders made wholly of the paste. They are used by the Chinese to burn before their idols, as slow matches in measuring time at night, and for lighting pipes, and are widely used by other peoples as deodorizers.

IMPORTS.

Imports in 1914 were valued at $6,888, which is far below the average for the years 1908–1920. In the calendar year 1920 imports were valued at $41,087. Practically all come from China, Hongkong, and Japan.

TARIFF HISTORY.

The provisions relating to joss stick or joss light in the tariff act of 1913 are identical with those in preceding acts.

INTERPRETATION AND COMMENTS.

A joss stick is a perfumed stick made of wood powder and paste, and burned by the Chinese in their temples as incense, and also for measuring time at night (Abstract 36003, T. D. 34604, of 1914; Abstract 37183 of 1915, Abstract 38901 of 1915); mosquito sticks and mosquito incense are not within this provision (T. D. 32699, of 1912). A protest claiming free entry of spunk as joss sticks was overruled without affirming the collector's classification of the importation as an unenumerated manufactured article (Abstract 38407, of 1915), but on an extended record spunk for lighting firecrackers was held dutiable as an unenumerated manufactured article (G. A. 8296, T. D. 38169, of 1919).

After many years of litigation from time to time under paragraph 521 and paragraph 608 for spunk, there is still doubt concerning these articles, which might be removed by omitting both paragraphs from the law and relegating the commodity in any form and however described to paragraph 385 (Schedule N, sundries) for unenumerated articles.

Imports for consumption—Revenue—Joss stick.

SPUNK.

GENERAL INFORMATION.

1913 tariff, paragraph.—608. Spunk. Free.

DESCRIPTION AND USES.

Spunk is a kind of tinder made from a species of fungus found on old trees. It is also called punk, amadou, black match, pyrotechnical sponge, and German tinder.

IMPORTS.

Imports are negligible. They amounted to $397 in 1912, the highest since 1908.

TARIFF HISTORY.

The provisions in the 1913 act relating to spunk are identical with those in preceding acts.

INTERPRETATION AND COMMENTS.

Merchandise invoiced as punk, reported by the appraiser as such and assessed as a nonenumerated manufactured article under paragraph 385, was held free of duty as spunk under this paragraph, the words "punk" and "spunk" being apparently interchangeable terms. (Abstract 41510, of 1917.) In a later case the merchandise under consideration was reported to be composed of a mixture of wood powder and paste, commonly used in this country for the lighting of firecrackers, and it was stipulated that the merchandise was of the same character as that the subject of Abstract 41510. In that case and other cases decided by the board and the courts, similar merchandise was, under the evidence, held to be in some cases spunk, a vegetable fungus growth, and in other cases the same as Chinese joss sticks (par. 521). In those previous cases the evidence was meager and the records unsatisfactory. In this case the evidence fully and clearly shows the merchandise to be neither joss sticks nor spunk, but a manufactured article intended and used for specific purposes. The different evidence distinguishes this case from those previously decided. The merchandise was held properly classified under paragraph 385. (G. A. 8296, T. D. 38169, of 1919; T. D. 37659, of 1918.)

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this, industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act, reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index," the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Guy G. George, of the Commission's staff, and others.

1920	[1] 50,061	25,079
1919 [2]	57,789	28,893
1920 [2]	55,464	27,733

[1] Includes imports from Cuba, which are negligible. [2] Calendar year.

GENERAL INFORMATION.

1913 TARIFF PARAGRAPH.

341. Dice, dominoes, draughts, chessmen, chess balls, and billiard, pool, bagatelle balls, and poker chips, of ivory, bone, or other materials, 50 per centum ad valorem.

DESCRIPTION AND MATERIALS USED.

DICE.

Dice are made from bone and are mostly manufactured in France, there being no manufacturers of dice in this country on a large scale. Due to the war and to restrictions placed on raw materials, also the shortage of labor, the manufacture of this article has declined. There are four establishments in the United States engaged in this industry.

DOMINOES AND CHECKERS.

Dominoes and checkers (draughts) are made of (*a*) pure ivory; (*b*) a composition consisting of celluloid, guncotton, camphor, and ivory dust; (*c*) bone, wood, and celluloid. Wood now is being employed more extensively in the manufacture. Previous to the war dominoes and checkers were chiefly produced in France, England, and Germany.

The method of manufacture of dominoes and checkers is almost entirely one involving the use of automatic machinery. In the manufacture of this article establishments have the ordinary facilities for

drying stock, rip-sawing, and gang-sawing it. After this point the use of automatic machinery is exclusive. These goods were imported into the United States in past years from Germany. From information at hand it appears that the processes employed in Germany are done very largely by hand, in judging from the quality of the work. The bulk of production of dominoes in the United States is designed to retail at 25 cents and less per set. There are 15 establishments.

CHESSMEN.

Wood is the material of chief value used in the manufacture. There are four establishments engaged in the industry. Two of the largest commenced operations in 1914. Previous to the war chessmen were chiefly manufactured in France, England, and Germany. The following is illustrative of dimensions and prices:

Size of king piece.

Height, 3¾ inches; diameter, 1 5/16 inches	$5.00
Height, 3¾ inches; diameter, 1¼ inches	6.00
Height, 4¾ inches; diameter, 1¾ inches	8.00

BILLIARD, POOL, AND BAGATELLE BALLS.

Billiard, pool, and bagatelle balls are made of bone, ivory, or a composition consisting of celluloid, guncotton, camphor, and ivory dust. When made of composition, the materials are boiled at a temperature of 280° and when cooled are hard and translucent. Pure ivory is not used so much now in the manufacture of billiard balls as formerly, though ivory is particularly valued for billiard balls and no equally good substitute has been found. There are eight establishments engaged in this industry.

POKER CHIPS.

Except for a limited quantity of celluloid chips there are two kinds, paper and composition chips. The raw materials used in the manufacture are paper for the unbreakable poker chips; plastic material, consisting of clay, rosin, shellac, and coloring matter, for the composition chips.

Japan is America's chief competitor in the production of poker chips. Shellac is the component material of chief value used in the manufacture of poker chips in Japan. The other ingredients used are calcium sulphate, barium sulphate, clay, cotton, color, shellac, rosin, and zinc sulphate.

To do an annual business of $50,000 it takes an investment of machinery and dies of fully $35,000 and the renewal of dies from $3,000 to $5,000 annually, as they wear out quickly. This amount also includes the replacement of machinery by reason of wear and tear. A business of this size can not turn out more than one and one-half times the value of machinery and investment per annum. The demand for poker chips is largely for the cheap grade on which the profit is small. The product has maintained a steady growth. There are nine establishments in the United States.

Composition-button manufacturers have been large manufacturers of poker chips, being most active between seasons of the button market. It is probable that they had different mechanical facilities from those concerns making poker chips only.

PRODUCTION IN THE UNITED STATES.

Statistics of production are not readily available. Establishments engaged in the manufacture of these articles are not given a separate classification by the census. Their products are included with those of establishments engaged in the manufacture of "Toys and games" and "Sporting and athletic goods."

IMPORTS.

The value of imports of all the articles rose gradually from $46,787 in 1910 to $68,780 in 1914. Practically all of the imports came from France and Germany. Imports from France amounted to $25,487, or a little over 79 per cent of the total for the year 1918.

Imports by countries.

DICE, DRAUGHTS, CHESSMEN, CHESS, BILLIARD, POOL, AND BAGATELLE BALLS AND POKER CHIPS OF IVORY, BONE, OR OTHER MATERIALS.

[Fiscal years.]

COURT AND TREASURY DECISIONS.

Pearl draughts or checkers, in chief value of mother-of-pearl, are dutiable under this paragraph and not as manufactures of pearl under paragraph 369. (Abstract 38337, of 1915.) *Chessboards and chessmen*, packed together, are dutiable as entireties under this paragraph rather than according to the component material of chief value under other paragraphs. (Abstract 40430, of 1916.)

TOYS.

SUMMARY.

There were 290 establishments in the toy industry in 1914, having a capital of $10,484,000, employing 7,887 wage earners and turning out products valued at $13,757,000. New York was the leading State in the toy industry, having 97 establishments credited with products valued at $3,713,000; Massachusetts was second with 18 establishments and a product of $2,536,000. Ohio, Pennsylvania, and Connecticut were also leading States in toy manufacture.

The American toy industry has developed in the face of severe competition from Germany, the world's leading toy maker prior to the war. In 1904 the value of products of the American toy industry was approximately $5,600,000, while the value of imports was nearly $5,000,000. In 1909 the value of domestic products increased to $8,264,135, and in 1914 to $13,757,000. The ratio of imports to domestic products was 80.2 per cent in 1909, but decreased to 66 per cent in 1914.

Imports for the calendar year 1919 were valued at $2,952,319, which was approximately only one-third the value of imports for the fiscal year 1914. The domestic industry has developed greatly since 1914, but exact figures will not be available until the present census reports are completed. The Toy Manufacturers' Association estimates the total value of toys produced in the United States in 1919 at about $30,000,000. The number of doll factories increased from 10 or 12 to probably 150, but the increase in other lines has not been so great. Exports from the United States in the calendar year 1919 reached a total of $2,869,529, which was almost exactly equal to the value of imports. Germany was the principal exporter to the United States prior to the war, but Japan is now in the lead, having gained this position since exports from Germany were cut off.

It appears that domestic production and exports have increased greatly since 1914, while imports have decreased. However, imports are again on the increase, and there is not sufficient data available upon which to base the assumption that the situation will remain so favorable for the American toy industry in the immediate future. Exports from Germany will no doubt increase, but may not regain their former volume for some time. Japan exported toys into the United States in the calendar year 1919 valued at $1,752,746.

A comparison of prices on dolls indicates that the American doll makers are being very much undersold for the year 1920. This is also true of celluloid toys and trains. However, dolls are said to be the most important item in the toy trade. It is said that toy buyers would not go abroad to buy if they could not secure dolls. They go to buy dolls and then pick up many other toys.

American dolls have generally been considered inferior in the past to German dolls, but at the present time fine-quality dolls with American-made bisque heads are being made in this country. Costs may become somewhat lower as the domestic manufacturers become more efficient, but the present difference in prices is great.

Summary table—Toys (including dolls and parts of).

General Information.

1913 TARIFF PARAGRAPH.

342. Dolls, and parts of dolls, doll heads, toy marbles of whatever materials composed, and all other toys, and parts of toys, not composed of china, porcelain, parian, bisque, earthen or stone ware, and not specially provided for in this section, 35 per cent ad valorem.

DESCRIPTION.

The articles made by establishments assigned to "Toys and games" are numerous. Among the principal classes included under this heading are: Dolls, electrical and mechanical toys, wooden toys, and indoor games. For the purposes of this survey it is not considered essential to enumerate the hundreds of individual items included under toys, but rather to deal with the industry as a whole, or with particular classes, such as dolls or electrical toys.

It should be noted that toys and games to the value of $1,609,555 in 1914 and of $1,156,411 in 1909 were reported by establishments assigned to other industries, principally hardware, planing mills, tinware, sawmills, wooden goods, furniture, etc. On the other hand, there is considerable overlapping between toys and games and such other industries as "paper goods, not elsewhere specified," "leather goods, not elsewhere specified," "carriages and sleds, children's," and "wood, turned and carved," the amount of which was not always disclosed by the census returns.

For practical purposes a toy may be defined as "an article which has been designed primarily for the amusement of a child." Some articles may be known commercially as toys which are not entirely covered by this definition. The greatest difficulty in classification is experienced with articles which emerge from the class of "toys" into the class of "real" articles used by adults, such as paint boxes, musical instruments, base balls, games, and articles of that description. The decision is based upon one or the other of the two principles above stated.

DOMESTIC PRODUCTION.

(*a*) *Size and importance of the industry.*—The census of 1914 reports 290 establishments engaged in the manufacture of toys and games, capitalized at $10,484,000, employing 7,887 wage earners, and credited with a product valued at $13,757,000.

(*b*) *Materials and methods of production.*—The toy industry is one requiring a great deal of hand labor. This is particularly true in Germany, where the industry, except in the metal toy factories of Nuremberg, has been entirely a home industry, engaged in at times by four generations working in the same home from 10 to 13 hours a day. In the United States, where the industry has developed mainly in the last 20 years, the manufacture of toys is carried on principally in factories. Every mechanical device that would aid in quantity production is employed, and constant improvements are being added. Child labor is not employed extensively in the United States.

The value of products of the toy industry in 1914 was $13,757,000, of which $7,978,000 was added by manufacture. From this comparison it appears that the material cost is not the principal cost of the toys produced.

Machinery is used in stamping out parts for metal toys and in cutting and finishing parts for wooden toys. In doll making machinery is used in cutting and sewing dolls' clothes, in making heads and bodies, and power-air brushes are used in painting heads and cheeks. A great deal of handwork is required, however, in making and finishing the head and in assembling, clothing, and packing the dolls. It is obvious that extreme standardization and the use of mechanical equipment will still leave a great deal of handwork to be done in decorating and assembling toys and dolls of practically all kinds.

The American manufacturer has at present several advantages in the manufacture of some lines of toys. He has developed new mechanical, structural, and electrical toys, which are superior to those manufactured in any country. He has also applied machinery wherever possible to secure quantity production. However, he faces competition in many lines from countries where the industry is carried on with little or no overhead factory expense and at a very low cost of production, or in a home in which the entire family works long hours and ekes out only a meager existence.

(*c*) *Organization.*—The capital invested in the toy industry in 1914 was $10,484,000. There were 290 establishments reported, thus making the average individual capital $36,151. The development of the industry has been great since the beginning of the war, and doubtless the next census will show a marked increase in both the number of establishments and the capital engaged in the industry.

The number of establishments in 1914 owned by individuals was 111; by corporations 127; and by other forms of ownership, 52. The average number of wage earners in establishments owned by individuals was 1,030; by corporations, 6,242; and by others, 615. The value of products of establishments owned by individuals was $1,723,000; by corporations, $10,948,000; and by others, $1,086,000. It will be seen that the corporate form of ownership dominates the industry.

The size of establishments is indicated by the value of products turned out. In 1914 there were 80 with a product of less than $5,000;

92 with a product of $5,000 to $20,000; 83 with a product of $20,000 to $100,000; 34 with a product of $100,000 to $1,000,000; and only 1 with a product over $1,000,000. The majority of establishments were, therefore, those with a value of products of less than $20,000, while the establishments with a large product were few in number.

Likewise, the majority of establishments employed only a small number of wage earners; 14 employing none; 198 employing not over 20; 60 employing from 20 to 100; 18 employing over 100; while only 4 of the 18 employed over 250 wage earners. The majority, 64.9 per cent, of the wage earners were men; 30.5 were women; and only 4.6 per cent were under 16 years of age.

(*d*) *Geographical distribution.*—The value of products of five States exceeded $10,000,000 in 1914. These States, with the number of establishments and value of products of each in 1914 were: New York, 97 establishments, with a product of $3,713,000; Massachusetts, 18—$2,536,000; Ohio, 36—$1,909,000; Pennsylvania, 36—$1,769,000; Connecticut, 14—$1,040,000. Some of the other States, with the number of establishments in each were: Michigan, 7; Indiana, 8; Illinois, 14; New Jersey, 13; New Hampshire, 7; and Vermont, 4.

(*e*) *History of the industry.*—The tariff rate has remained at 35 per cent ad valorem on ordinary toys since 1883, except for three years under the act of 1894, when it was reduced to 25 per cent. The development of the industry has not been affected, therefore, by fluctuations in the tariff rate. There has, however, been a marked increase in imports.

In 1879 the value of products of the industry reached a total of $1,562,513. By 1899 this had increased to a total of $4,000,000. From 1899 to 1914 the total value of products more than trebled, reaching an approximate total of $14,000,000. Imports increased in value from about $2,500,000 in 1899 to approximately $8,600,000 in 1914.

(*f*) *Domestic production and consumption.*—The American market for toys is perhaps the best in the world. Germany consumes only a very small part of her toys. Her annual production before the war was estimated at about $33,000,000, while her exports in 1913 were valued at over $24,000,000, of which about one-third went to the United States. On the other hand, the United States added imports valued at nearly $9,000,000 to her domestic production of $14,000,000, exporting toys valued at only $769,000. It would appear that the toys consumed in the United States in 1914 were nearly double the value of toys consumed in Germany, the world's greatest toy maker before the war.

Although imports from Germany were cut off during the war, the American manufacturers met the increased domestic demand and were able to export toys valued at $2,000,000 in 1918.

(*g*) *Domestic exports.*—Prior to the war exports of toys from the United States averaged somewhat less than $1,000,000 annually. In the year 1916 the value of exports reached a total of $2,030,089. The year 1917 recorded a slight decline, while the year 1918 was practically the same as 1916.

Toys were exported to Canada, England, Cuba, Australia, Germany (before the war), and other countries. Exports of toys were not separately stated prior to 1918, but in 1918 toys were divided into dolls, $356,363; mechanical toys, $198,792; and all other, $1,468,469.

The value of exports of dolls and parts of dolls for the calendar year 1919 was $454,770. Exports of mechanical toys were valued at $224,628, and all other toys were valued at $2,190,131.

FOREIGN PRODUCTION.

(*a*) *Germany.*—Before the war Germany was the world's greatest toy maker. Nuremberg and Sonneberg are the two principal centers of the German toy industry. Nuremberg is principally engaged in the manufacture of metal toys, of "lead, tin, and pewter soldiers; of mechanical toys; of animals that walk and birds that fly; of dogs that bark and dolls that talk, * * *." Sonneberg is the center of the wooden-toy industry.[1]

At least 100,000 persons were employed in the manufacture of toys in Germany, the districts of Nuremberg and Sonneberg employing about 30,000 operatives each. The annual production was estimated at about $33,000,000. The exports of 1913 were valued at $24,594,000. The United States was Germany's best customer, taking nearly one-third of the total exports, while the United Kingdom was second, taking one-fourth of the total exports.[2]

In Nuremberg the metal toys are produced largely in factories, there being about 200 factories located in Nuremberg and Furth, which is 6 miles distant from Nuremberg. Outside of Nuremberg practically all the toys produced in Germany are made in the workmen's homes. The entire family is employed, usually on one article on which the family has specialized for many generations. It is not uncommon to find several generations at work in one home.

The present condition of the German toy industry is not known in detail, but it suffered heavily by the war. Exports to the United States and the United Kingdom, which represented approximately one-third and one-fourth, respectively, of the total exports, were cut off. Less than 5 per cent of her exports went to her allies before the war, and a little over 7 per cent to the Scandinavian countries, the Netherlands, and Switzerland. The overseas markets were closed during the war, and the exports to neutral countries declined.[3]

In Sonneberg a company was formed to assist the destitute toy makers by employing them in war trades. A suggestion has been made to inaugurate a "day of gifts" to be celebrated in the same manner as Santa Claus day, but to be held in midsummer, in order to stimulate home consumption of toys.

There is a shortage of textiles used in the doll industry. The increase in factory costs has been great—higher wages and shorter hours being the rule. The shortage of coal has cut down factory production. The greatest difficulty the industry will face will be the problem of regaining its lost markets. It will have to face the increased production of toys in the United States and Japan, whose markets are well supplied and who are entering the export field, particularly Japan. Until the German toy makers can regain lost markets it is safe to say that the industry can not attain its prewar proportions and prosperity.

(*b*) *Japan.*—The toy industry in Japan has greatly increased since the beginning of the war. Mr. M. Iketani, writing in the Japan Sales-

[1] Harper's Bazar, January, 1911.
[2] Miscellaneous Series No. 65, 1918, Department of Commerce.
[3] Miscellaneous Series No. 65, Department of Commerce.

man, January, 1918, states that the annual production of toys had reached a value of 10,000,000 yen (about $5,000,000), of which 8,000,000 yen was exported. The following figures are taken from Official Japanese Statistics for Exports:[4]

[Yen=$0.50.]

	1916	1917	1918
Total export	$3,820,000	$4,204,759	$5,095,014
Export to United States	1,215,008	1,895,249	810,999

Exports to China, British India, and Australia exceeded $500,000 in value to each country in 1918. For the 10 months ending October 31, 1919, the export of toys reached a total of $4,699,695.

It will be seen from the above figures that the Japanese toy industry grew rapidly. Production in 1918 evidently exceeded the figure quoted by Mr. Iketani, which was no doubt for the year 1917. Tokyo is the principal center of the industry, producing about one-half of the total. Osaka is second, producing toys valued at over $1,000,000; Aichi is third, with a value of about $500,000.

The toy industry in Japan is similar to that in Germany in that it is carried on almost entirely in the home. This keeps the cost at a low level. Dolls are made in the pottery centers as a by-product. When toys are made in factories, the cost is quite low, the adult workman averaging 65 cents per day in wages, according to an extract from Commerce Reports, February 26, 1920. Japan also has the possibilities of developing a good market in her own part of the world, as well as in South America, Europe, and Africa.

(c) *France.*—It was estimated that one-third of the total number of toys sold in France in the year 1913, amounting to approximately $5,000,000 in value, was of German origin. Of all imported those from Germany amounted to four-fifths. It was the consensus of opinion among the larger toy dealers that 25 per cent of the finished toys sold in France before the war were of German production and that 50 per cent of all toys and toy parts were "made in Germany."

The finished toys of German importation consisted mostly of mechanical and rubber toys, while such parts as doll heads and glass eyes were also imported. Frequently a finished article put out as a French product consisted mainly of parts or pieces of a set made in Germany but assembled and packed in France.[5]

The following table[6] shows the value of imports into and exports from France for the years stated, and indicates that exports of toys are much larger than imports. Exports went mainly to England.

	1912	1914	1916	1918
Imports	$3,292,194	$1,158,000	$650,217	$337,750
Exports	10,257,757	6,819,462	7,626,202	5,758,348

[4] Annual Return of the Foreign Trade of the Empire of Japan, 1918.
[5] Notes from Commerce Reports, Apr. 7, 1919.
[6] Statistics taken from "Documents Statistiques sur le Commerce de la France;" calendar years; franc=$0.193.

Imports into the United States from France, as indicated by Commerce and Navigation of the United States, have fluctuated in value from about $200,000 to $100,000, averaging about $150,000 annually. Exports from the United States to France have been small.

(d) *England.*—While an attempt has been made to stimulate the production of toys in England as in other countries, the statistics as here given show only a small difference between the value of imports and exports. In 1914 exports exceeded imports in value, while in 1918 imports slightly exceeded exports in value. France took the place formerly occupied by Germany as the leading source of imports into the United Kingdom. Exports went principally to the British Possessions.

	1914	1917	1918
Imports from [1]—			
Total	$3,408,598	$1,262,536	$2,177,460

[1] From "Annual Statement of the Trade of the United Kingdom," 1918, calendar years; pound sterling=$4.8665.

IMPORTS.

Imports for consumption of toys were valued at $6,628,683 in the fiscal year 1910. The year 1911 increased the total value to $8,159,244. The next two years showed a small decrease, the total falling a little below $8,000,000, but in 1914 the high total of $9,090,972 was reached. The ratio of imports to domestic production decreased from 80.2 per cent to 66 per cent from 1910 to 1914.

The decline in the value of imports has been rapid since 1915, and the low mark was reached in 1917, with a value of $1,492,541. The year 1918 recorded imports of toys valued at $2,009,014.

Germany dominated the American import trade before the war, furnishing about 90 per cent of the total. Imports from Japan have shown a remarkable growth, increasing from a value of $197,302 in 1910 to a total of $1,910,417 in 1918, the value having passed the half-million mark in 1916. The United Kingdom, France, and Austria-Hungary were also exporters to the United States.

Imports of toys were all grouped together under one heading prior to 1912. Since 1912 dolls have been separately stated, their average import value from 1912 to 1915, inclusive, being about $1,500,000.

In the fiscal year 1917 the imports of dolls amounted to only $123,134, but the imports of dolls in the calendar year 1919 were again heavy, $1,232,344; in fact, they were nearly equal in value to the imports of dolls in prewar years. The imports from July to

December, 1919, reached a total value of $1,026,975, of which $451,826 came from Germany and $742,537 from Japan. Before the war nearly all the imported dolls came from Germany, but at the present time Japan appears to be the principal exporter to the United States.

Imports of all other toys and parts have not increased so greatly since the war as have dolls. Their average value before the war was about $6,500,000 annually; in 1917 their value was less than $1,500,000; while in the calendar year 1919 they reached a total value of $1,719,975, of which $1,010,209 came from Japan and $ 31,904 from Germany. July to December were the months of largest importation.

PRICES.

The comparative prices on similar dolls given in this discussion should be considered merely as an indication of the competitive situation as it existed in the spring of 1920. The data does not cover a large number of domestic manufacturers and importers, nor does it cover a wide range of items. It is believed, however, that the limited data presented is fairly representative of the entire situation.

Prices, in dollars per dozen.

DOLLS,[1] JOINTED.

Approximate size (inches).	Bisque heads.		Composition heads, American: Lowest net jobber's price.
	American: Lowest net jobber's price.	Imported: Estimated landed cost plus 20 per cent.	
20	$63–$81	$24.20–$46.46	$54
24	84–108	31.56– 65.31	$60– 72

18	75– 93	31.14	36.50– 54
22	126	44.61–104.76	68.00– 78

[1] Some of the finest quality imported dolls now on hand or which are now being distributed were imported at the low figure or at about an average between the high and low figures. Shipments at the high quotations are not large. Japanese bisque dolls generally range considerably higher than German dolls. The wide range in prices is frequently partly due to a difference in construction. There appears to be a wide range, however, on very similar items.

Explanation of methods followed in compiling doll prices.—Figures for imports were collected from invoices of actual shipments of goods received, except in one case quotations on a shipment of samples was included, and these quotations were high. The exchange value of marks and yen as indicated by the consular invoice was the value used in converting to dollars. The case charges vary considerably, but 6 per cent was taken as a fair average charge. This charge is added to the purchase price, and this total is the amount upon which duty and other charges are assessed.

Landing charges to New York were estimated at 64 per cent of the total amount upon which duty is assessed for German goods, and at

80 per cent for Japanese goods. The landing charges for German goods were divided up about as follows: Duty, 35 per cent; inland freight, 10 per cent; ocean freight, 15 per cent; insurance, 2 per cent; cartage, legalization, entry charges, etc., 2 per cent. The landing charges for Japanese goods are similarly divided, but are higher. These charges are based upon freight rates as they were in the spring of 1920.

Some German importers claim that their landing charges are much higher than 64 per cent, but this appears to be due to jobber's commissions on the other side, or to the fact that they made settlement in marks owned at a higher value than the exchange value at the time of shipment. This charge is thought to be a fair landing charge at present freight rates for direct importers of German goods.

The American prices quoted are the lowest net wholesale selling price to jobbers. Manufacturing costs per dozen were not available in some cases. In answer to the argument that American manufacturers should lower their prices, they assert that they are scarcely making a fair profit.

For the purposes of comparing American jobbers' prices with imported prices, 20 per cent was added to the estimated landed cost of imported articles. This should yield a fair profit to the importer, if not a large profit.

Description of the dolls quoted.—The jointed bisque dolls have moving glass eyes, usually with eyelashes (American manufacturers have been using celluloid eyes, but are now using glass eyes also); mohair sewed wigs, occasionally human-hair wigs; composition fully jointed legs and arms and composition bodies (papier-mâché is used largely by the German manufacturers); and they are dressed only with a chemise.

The character baby dolls have curved arms and legs, jointed only at the hips and shoulders, and their wigs are usually short or bobbed. Otherwise they are generally similar to the jointed dolls.

The American dolls with composition heads and moving eyes are generally considered inferior to dolls with bisque heads, but the comparison is given to indicate the comparative prices of this kind of doll with the highest quality imported bisque dolls. The American dolls with painted eyes and cork-stuffed bodies, usually without hair, are in a class entirely by themselves at the present time, and prices are not quoted in this discussion.

The articles quoted compare almost exactly as to size, but the Japanese toys are more fragile. They are, however, more profusely decorated than the American, and hand painting is costly to the American manufacturer.

The Japanese celluloid toys as priced at the present time compete with the American in the 5 and 10 cent stores, which have been the largest buyers of celluloid toys. The above comparisons show that the margin of profit on a gross of American celluloid toys retailed in the syndicate stores is very small, and in some cases they can not be sold at all. In the department stores quality counts for more than price to many customers, and the higher priced American toys frequently sell more readily at a higher price than the Japanese, because they are more substantial; particularly is this true when the two are placed on the same sales counter.

Trains.—Quotations on mechanical and electrical trains would disclose individual firm prices and they are, therefore, withheld. However, a standard American mechanical train, consisting of an iron locomotive and three stamped sheet-steel cars and a tender, was compared with a similar imported train. The comparison was quite exact. The estimated landed cost of the imported train, plus 20 per cent, was substantially under the lowest net jobber's price for the American. A similar comparison with a standard electric train also showed the imported to be under the American price.

Other toys.—Quotations on American tin toys were available, but no imported tin sets were found. Germany is said to be short of white tin used in the lithographed tea and coffee sets.

There is competition in many other lines of toys, but dolls are said to be one of the controlling factors in the toy trade, and competition appears to be most keen in dolls.

COMPETITIVE CONDITIONS.

From a review of the imports of dolls and toys during the calendar year 1919, particularly the latter part of the year, it appears that Japan and Germany are the principal competitors of the American manufacturers in the domestic market, with Japan in the lead at the present time.

The total importation of dolls and toys from July to December, 1919, was nearly $2,500,000. Exports from the United States for the same period amounted to $1,847,875.

Until the next census is completed no accurate estimate of the present volume of domestic production can be made, but the increase has been great. The Toy Manufacturers Association estimates that the number of doll manufacturers alone has probably increased from 10 or 12 to 150. There has also been an increase in the number of manufacturers of mechanical and structural toys. The value of products of the entire industry in 1914 was nearly $14,000,000. The toy association estimates the value of products in 1919 at a total of $30,000,000.

Information upon which to base an accurate statement of future foreign competition is not available. Doubtless there is at present a smaller production of toys in Germany than before the war, but this may be only a temporary condition. On the other hand, Japan has increased her production and exportation of toys, and is able to quote prices to meet competition.

The American manufacturer seems to have succeeded mainly in the production of new kinds of toys and in the application of the principles of quantity production to certain wooden and metal toys. The industry in Germany and Japan is characterized by the home-work system, and before the war in the factories long hours and low wages prevailed. In Japan at the present time (Commerce Reports, Feb. 26, 1920), the adult factory workman averages 65 cents a day in wages. Present factory wages and hours in Germany are not known.

TARIFF HISTORY.

Dolls and toys were enumerated in the tariff act of 1894 at 25 per cent ad valorem. The act of 1897 raised the duty to 35 per cent, which was the rate prevailing before the act of 1894. There has been no change in the duty on ordinary toys since the act of 1897.

The values of imports and domestic products have increased at the same time, but domestic products appear to be gaining on imports in meeting the domestic demand for toys. It is obvious, however, from reference to the statistics on page 12, that the toy industry has had, in the past, very severe competition to meet.

Rates of duty—Dolls, doll heads, and toys.

Act of—	Par.	Tariff classification or description.	Rates of duty, specific and ad valorem.
1883	425	Dolls and toys	35 per cent ad valorem.
1890	100	China, porcelain, parian, bisque, earthen, stone, and crockery ware, including * * * toys, * * *:	
		Painted, tinted, stained, enameled, printed, gilded, or otherwise decorated or ornamented in any manner.	60 per cent ad valorem.
		If plain white, and not ornamented or decorated in any manner.	55 per cent ad valorem.
	436	Dolls, doll heads, toy marbles of whatever material composed, and all other toys not composed of rubber, china, porcelain, parian, bisque, earthen or stone ware, and not specially provided for in this act.	35 per cent ad valorem.
1894	84	China, porcelain, parian, bisque, earthen, stone, and crockery ware, including * * * toys, * * * white, not changed in condition by superadded ornamentation or decoration.	30 per cent ad valorem.
	85	China, porcelain, parian, bisque, earthen, stone, and crockery ware, including * * * toys, * * * painted, tinted, enameled, printed, gilded, or otherwise decorated in any manner.	35 per cent ad valorem.
	321	Dolls, doll heads, toy marbles of whatever material composed, and all other toys not composed of rubber, china, porcelain, parian, bisque, earthen or stone ware, and not specially provided for in this act. This paragraph shall not take effect until Jan. 1, 1895.	25 per cent ad valorem.
1897	95	China, porcelain, parian, bisque, earthen, stone, and crockery ware, including * * * toys, toy tea sets, * * *:	
		Painted, tinted, stained, enameled, printed, gilded, or otherwise decorated or ornamented in any manner.	60 per cent ad valorem.
		If plain white and without superadded ornamentation of any kind.	55 per cent ad valorem.
	418	Dolls, doll heads, toy marbles of whatever materials composed, and all other toys not composed of rubber, china, porcelain, parian, bisque, earthen or stone ware, and not specially provided for in this act.	35 per cent ad valorem.
1909	93	China, porcelain, parian, bisque, earthen, stone, and crockery ware, including * * * toys, * * * all the foregoing wholly or in chief value of such ware; painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner; * * *.	60 per cent ad valorem.
	94	China, porcelain, parian, bisque, earthen, stone, and crockery ware, plain white, plain brown, including * * * toys, * * *, all the foregoing wholly or in chief value of such ware, not painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner: * * *.	55 per cent ad valorem.
	179	* * * toys, * * * made wholly or in chief value of tinsel wire, lame or lahn, bullions, or metal threads.	15 cents per pound and 60 per cent ad valorem.
	431	Dolls, and parts of dolls, doll heads, toy marbles of whatever materials composed, and all other toys, and parts of toys, not composed of china, porcelain, parian, bisque, earthen, or stone ware, and not specially provided for in this section.	35 per cent ad valorem.
1913	79	Earthenware and crockery ware composed of a nonvitrified absorbent body, including white granite and semiporcelain earthenware, and cream-colored ware, and stoneware, including * * * toys, * * * :	35 per cent ad valorem.
		If plain white, plain yellow, plain brown, plain red, or plain black, not painted, colored, tinted, stained, enameled, gilded, printed, ornamented, or decorated in any manner. * * *	
		If painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner. * * *	40 per cent ad valorem.
	80	China and porcelain wares composed of a vitrified nonabsorbent body which when broken shows a vitrified or vitreous, or semivitrified or semivitreous fracture, and all bisque and parian wares, including * * * toys, * * * :	
		If plain white, or plain brown, not painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner; * * *	50 per cent ad valorem.
		If painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner. * * *	55 per cent ad valorem.
	150	* * * toys, * * * made wholly or in chief value of tinsel wire, lame or lahn, or of tinsel wire, lame or lahn, and india rubber, bullions, or metal threads, not specially provided for in this section.	40 per cent ad valorem.
	342	Dolls, and parts of dolls, doll heads, toy marbles of whatever materials composed, and all other toys, and parts of toys, not composed of china, porcelain, parian, bisque, earthen or stone ware, and not specially provided for in this section.	35 per cent ad valorem.

NOTE.—The foregoing are the specific provisions for toys and dolls; rubber toys came within the general provision manufactures of rubber.

COURT AND TREASURY DECISIONS.

There has been no substantial change in the provisions for toys since the act of 1883. Yet under each of the acts there has been much litigation. Suggestions intended to make classification more certain were not deemed effective and have not been adopted in subsequent acts. For example, in 1909 (Tariff Hearings, 1908-09, vol. 6, p. 6618), it was proposed to insert in the tariff act a provision making the rate of duty on toys the same as that imposed upon "Miscellaneous manufactures of the material of which such toys are wholly or in chief value composed." The materials therein set forth (p. 6620), in the order of percentage, are metal, cotton, paper, rubber, wood, glass, china, fur, skin, wool, papier-mâché, celluloid, leather, silk, gallilith, pearl, bone, and willow, metal constituting 45 per cent of the total importations. The extent to which such a provision would go was indicated by the classification of toys of wool, which, being subject to compound duties, would have had not only to be valued to ascertain the ad valorem rate, but weighed in every case to determine the specific duty. The magnitude of that work is apparent from the volume of imports.

The scope of the provision has been somewhat limited by the definition of toys as playthings intended and designed for the amusement of children only and which by their very nature and character are reasonably fit for no other purpose. (Illfelder *v.* United States, 1 Ct. Cust. Appls. 109, 111, of 1910; Carsons *v.* United States, 2 Ct. Cust. Appls. 386, of 1911.) Cheapness does not determine classification (Pacific Mail Steamship Co. *v.* United States, 3 Ct. Cust. Appls. 102, of 1912; United States *v.* Bernard, 5 Ct. Cust. Appls. 202; United States *v.* Kramer, 5 Ct. Cust. Appls. 294, of 1914); nor does flimsiness (Thanhäuser, 159 Fed. 228, of 1908; Pacific Mail Steamship Co., 3 Ct. Cust. Appls. 102, of 1912); nor does their sale to or in toy shops (United States *v.* Cattus, 167 Fed. 532, of 1909; Hamburger *v.* United States, 2 Ct. Cust. Appls. 234, of 1911). But such limitations must yield to proof of commercial designation as toys. (Zeh *v.* Cadwalader, 151 U. S. 171; Pacific Mail Steamship Co. *v.* United States, 3 Ct. Cust. Appls. 102, of 1912.) By agreement between the Government and importers a decision of the Court of Customs Appeals (Illfelder *v.* United States, 7 Ct. Cust. Appls. 53, of 1916) upon so-called water-color boxes is not applied to paints or colors in wooden or paper boxes valued at less than 100 marks per gross, or in metal boxes valued at less than 25 marks per gross, or the equivalent in each case in francs. Such paints or colors are classified as toys. (T. D. 37168, of 1917.)

In a decision of the Supreme Court under the act of 1883, plates and mugs decorated with pictures and with the letters of the alphabet, intended for children, and known in trade as "A B C" plates and mugs, were held dutiable as decorated earthenware and not as toys. (Maddock *v.* Magone, 152 U. S. 368.) In cases under the acts of 1897 and 1909 china dolls and dolls' heads were held dutiable under the provision for dolls and doll heads.

Among articles recently held not to come within the provision for toys are cardboard bells painted and used in the manufacture of Christmas-tree ornaments (G. A. 8317; T. D. 38255); a bag of netting and red cotton material with head representing Santa Claus attached

to the top, and at the bottom two legs with feet intended as a container for small articles, such as candy, to be suspended on Christmas trees (Abstract 43770, of 1920); and strings of small hollow, globular articles of gilded glass with a hole running through the center, and hollow colored glass balls with a metal ring attached, also for Christmas-tree ornaments (Abstract 43423, of 1919), and flimsy baseballs in chief value of cotton (Abstracts 43595, 43596, of 1920). On the other hand, dolls in part of lace were held dutiable under paragraph 342 rather than as articles made in part of lace under paragraph 358 of the act of 1913. (Abstracts 43619, 43760, of 1920.) Toys of tinsel wire, lame or lahn, and india rubber are dutiable under paragraph 150 of the act of 1913; also toys of such materials and other component material if the combined values of the tinsel wire, lame or lahn, and india rubber exceed the value of the other component material. (T. D. 34027.)

Small sewing machines fitted for other purposes than the amusement of children do not come within the toy provision, but within the provision (par. 441 of the act of 1913) for sewing machines. (Abstracts 40043 and 40387, of 1916; Abstract 40753, of 1917; and Abstracts 43580, 43641, and 43766, of 1920.)

Whether such articles as knives, however small, should be regarded as toys is questionable. They have been classified both as toys and as knives. In G. A. 2492, T. D. 14809, knife and fork sets; and in G. A. 3482, T. D. 17165, table knives and forks not exceeding 5 inches in length, including the handle, were classified as toys. On the other hand, in G. A. 6264, T. D. 26996, minature penknives having a single blade, and in Kastor *v.* United States, 167 Fed. 993, small knives with odd-shaped handles which can not be effectively used for ordinary purposes as a pocketknife, but which were not in fact used as playthings, and neither kind of the knives being commercially known as toys, were held dutiable as penknives.

EMERY GRAINS, WHEELS, ETC.

[Par. 343. For treatment see par. 75.]

CURLING STONES, OR QUOITS, AND CURLING-STONE HANDLES.

SUMMARY.

The manufacture of curling stones is not an industry in the United States, and quoits are made to only a small extent by iron founders to satisfy the domestic demand.

Imports of curling stones come chiefly from the United Kingdom, whereas the quoits used in this country are mostly of domestic manufacture. Annual imports of curling stones and quoits, since 1907, ranged from $3,447 in 1914 down to $188 in 1919.

There is no indication that the demand for curling stones and quoits will ever be large enough to develop a manufacturing industry of importance in the United States, and as a possible source of import revenue these articles are insignificant.

Summary table—Curling stones, or quoits, and curling-stone handles.

Fiscal year.	Value (imports for consumption).	Equivalent ad valorem rate.

NOTE.—Curling stones and handles are not manufactured in the United States.

GENERAL INFORMATION.

TARIFF PARAGRAPH, ACT OF 1913.

PAR. 470. Curling stones, or quoits, and curling-stone handles. Free.

DESCRIPTION.

A curling stone is a flattish round stone, about 9 inches in diameter, prepared by stone hewers, and weighs from 30 to 45 pounds. In shape a curling stone resembles a small convex cheese with a handle in the upper side.

Curling stones are employed in playing the game of "curling," a sport originating in Scotland, where it is played by all classes of people in winter; it is also played in England, Ireland, Canada, United

States, and other countries. In playing the game sides are made up, usually consisting of four against four, with a director, styled "skip," for each; after which a certain length of ice, of from 30 to 40 yards and 8 or 9 feet across, is chosen. This is called the "rink." Certain marks are then made at each end of the rink, consisting of several concentric rings, called "broughs," and a center, called a "tee." One on each side plays alternately, the chief object of the player being to hurl his stone along the ice toward the tee with proper strength and precision, and on the skill displayed by the players in placing their own stones in favorable positions or in driving rival stones out of favorable positions depends nearly all of the interest of the game.

A metal quoit, for outdoor sport, is a circular piece of iron from 4½ to 6 inches in external diameter, between 1 and 2 inches in breadth, and weighs from 1½ to 3 pounds. It is convex on the upper side and slightly concave on the under side, so that the outer edge curves downward and is sharp enough to cut into soft ground. Quoits for indoor sport are made of gutta percha.

Quoits are used in playing the game of "quoits." In the outdoor sport two pins, called "hobs," are driven part of their length into the ground some distance apart, and the players, who are divided into two sides, stand beside one hob and in regular succession throw their quoits (of which each player has two) as near the other hob as they can. The side which has the quoit nearest the hob counts a point toward game, or if the quoit is thrown so as to surround the hob it counts two.

DOMESTIC PRODUCTION.

The manufacture of curling stones is not an industry in the United States, the small domestic requirements being supplied by importation from Europe. Quoits are cast by iron founders in various parts of the country in sufficient quantities to satisfy the domestic demand.

Statistics of production and consumption are not available, but the amounts are small. Curling stones are used only where there is strong ice in areas sufficiently large to accommodate the game of "curling," and their sale, therefore, is limited practically to the States in the northern parts of the country. The quantities imported represent, practically, the amounts consumed. Quoits, on the other hand, are used in all parts of the country during the greater part of the year. However, the game of "quoits" is played to only a limited extent in the United States, it being most popular in the north-central and northeastern parts of the country. This, and the further fact that quoits being an almost compact mass of solid iron which with ordinary care lasts for generations, reduces the annual requirements for the article. The demand in this country for curling stones and quoits is small, the annual sales amounting possibly to $10,000.

Domestic exports.—The United States has no export trade in curling stones or quoits.

IMPORTS.

Customs officials do not distinguish between imports of curling stones and imports of quoits; separate statistics are therefore not available. Of the total annual importation of curling stones and quoits the largest quantity imported since 1894 occurred in 1914 and amounted to $3,447. In 1919 the total quantity imported amounted to only $188.

Curling stones are not manufactured in the United States, and it is not likely that quoits are imported, at least in significant amounts. It appears, therefore, that official statistics of imports of these articles represent curling stones only. Imports are received chiefly from the United Kingdom and go mostly to States bordering on the Great Lakes.

TARIFF HISTORY.

Curling stones and quoits have entered the United States free of duty since 1872, having been given special mention for the first time in the tariff act of that year.

COMPETITIVE CONDITIONS AND TARIFF CONSIDERATIONS.

The demand for curling stones in the United States has never been large enough to justify the establishment of a manufacturing industry, and the prospect is that it will never be much, if any, greater than it has been in the past, the use of curling stones being limited to a few winter months of each year and confined to only a few States in the northern part of the country.

Quoits can be made in any of the many iron foundries of the United States at small manufacturing cost. The process is a simple one of casting, no finishing or polishing operations being required. American foundry facilities and raw material are abundantly sufficient to supply all domestic demands. It is not likely that foreign countries can compete successfully in the markets of the United States on quoits.

It is not considered that there is any tariff problem of consequence in the case of either curling stones or quoits.

Imports for consumption—Revenue—Curling stones, or quoits, and curling-stone handles.

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for, and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by the use of this "Introduction and index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Frank S. Sanford and Joseph M. Donohoe, of the Commission's staff, and of others.

CORK.

SUMMARY.

Cork bark or wood.—Cork is the bark of an evergreen oak common to southern Europe and northern Africa. The trees grow to a height of 40 or 50 feet, average 12 inches in diameter, and live to a great age. The bark is stripped at intervals of nine years, each tree yielding an average of about 45 pounds. Portugal is the leading producer, growing about one-third of the world's supply. Most of this is exported unmanufactured. The remaining supply comes from Spain, France, Italy, Algeria, Tunis, Morocco, and Korea, that from Korea differing in some respects from true cork. In 1912 the United States Forestry Service planted cork oaks in Florida for experimental purposes, but none is grown in this country for commercial use. Spain is a large manufacturer of cork products, exporting very little unmanufactured bark. An export tax on bark is imposed by both Spain and Portugal.

The principal products of cork are bottle stoppers, or corks; disks or wafers used in the crimped metallic stoppers known as crown corks; cork paper, used chiefly for the tips of cigarettes; seine floats and fillers for life preservers; and insulation board made from cork waste or shavings. Numerous other articles, for which it is particularly adapted because of its qualities of lightness, compressibility, elasticity, and imperviousness to water, are also made.

The domestic industry, although required to import the raw bark, is an important one. In 1914 there were 52 establishments with capital of $7,602,000. Production, which embraced to some extent practically all manufactures of cork except cork paper, amounted to $7,875,000. Importations of bark are chiefly from Portugal and Spain. The more important domestic products are the higher grade corks, cork disks, and insulation board. Hand cutting has been replaced entirely by machinery. A large portion of the machinery is automatic, but in some classes skilled hand work is necessary. An instance of this is in the punching of the high-grade corks, where it is necessary for the operative to so guide the bark that the best portions are punched.

Great skill is required in sorting, both of the bark and of the finished articles. Proper sorting of the bark for the various purposes is very important, profitable, and economic operation depending on this to a very large extent. Even with careful sorting it is not possible to secure a uniform finished article, which necessitates the second sorting after the corks are completed.

Spain is a very strong competitor in the domestic market having, in addition to the native supply of bark, the advantages of an export tax on unmanufactured bark, and skillful labor at less cost than domestic labor. The Spanish industry is also very generally equipped with modern machinery, and the cheaper labor is on a par in production with our own.

Imports of cork bark and waste amounted to $6,338,330 in 1920, the imports of manufactures of cork amounted to $1,969,203, while the value of domestic exports was $2,022,174.

Cork—Summary table.

	Domestic production.	Imports for consumption, free and dutiable.	Domestic exports.	Ratio to production, exports (per cent).	Value, imports, for consumption (manufactures).	Amount of duty.	Equivalent ad valorem rate.

1913 TARIFF PARAGRAPH.

340. Cork bark, cut into squares, cubes, or quarters, 4 cents per pound; manufactured cork stoppers, over three-fourths of an inch in diameter, measured at the larger end, and manufactured cork disks, wafers, or washers, over three-sixteenths of an inch in thickness, 12 cents per pound; manufactured cork stoppers, three-fourths of an inch or less in diameter, measured at the larger end, and manufactured cork disks, wafers, or washers, three-sixteenths of an inch or less in thickness, 15 cents per pound; cork, artificial, or cork substitutes manufactured from cork waste, or granulated corks, and not otherwise provided for in this section, 3 cents per pound; cork insulation, wholly or in chief value of granulated cork, in slabs, boards, planks, or molded forms, ¼ cent per pound; cork paper, 35 per centum ad valorem; manufactures wholly or in chief value of cork or of cork bark, or of artificial cork or bark substitutes, granulated or ground cork, not specially provided for in this section, 30 per cent ad valorem.

464. Cork wood, or cork bark, unmanufactured, and cork waste, shavings, and cork refuse of all kinds. Free.

DESCRIPTION AND USES.

Cork, as its name implies, is the cortex or bark of a species of evergreen oak indigenous to southern Europe and northern Africa. The trees attain a height of 20 to 40 feet, live to great age (300 to 400 years), and average approximately 12 inches in diameter. Specimens occasionally are found as much as 12 feet in circumference. The bark is silvery gray and is quite unlike the bark of other oaks in texture. Its thickness and quality vary with the soil and climatic conditions. If the ground is rich and damp the bark is

thick and generally open and poor in quality. The best cork comes from the mountainous districts where the soil is thin and the rainfall not very abundant.

It is stripped from the tree during July and August, at intervals of about nine years. Longitudinal and transverse incisions are made to the proper depth and the bark then pried off in slabs, great care being taken not to injure the tree. Commercial bark varies from one-half inch to 2 inches in thickness, occasionally 2½ inches. It is taken from both the trunk and limbs, the thicker bark coming from the trunk. Also young vigorous trees furnish thicker bark than older ones. The average yield per tree is 45 pounds.

Practically the entire world's production is obtained from Portugal, Spain, France, Italy, Tunis, Algeria, and Morocco, Portugal producing about one-third. From Korea a species of cork is also obtained which possesses some but not all the qualities of that from the Mediterranean countries.

The industrial uses of cork are many, the various articles into which it is manufactured being too numerous to enumerate. Its best known field of utility is in the manufacture of cork stoppers, and cork disks. The latter are used as washers in the crimped metallic stopper known as "crown" corks now almost universally used on containers for mineral waters, ginger ale, beer and other beverages. Other uses for which it is very desirable because of its qualities of lightness, elasticity, compressibility and impermeability to water are floats of nets, life preservers, swimming belts, etc.; smokers mouthpieces and cigarette tips; insulation for refrigerators and pipes; in doors and telephone cells to deaden sound; toys; insoles; polishing wheels and rubber for burnishing glass and gold; displaying cutlery; in balls, toys and games, and many other articles, either made from the cork in its natural state or from the waste or shavings as a composition.

In powdered form cork waste is used in making linoleum and other floor coverings, this use being specially provided for in the tariff (par. 276).

Cork bark, cut into squares, cubes or quarters, is a preliminary step in the cutting of corks, generally those made by handwork. Very small imports of it in this condition are made.

Substitutes.—No altogether satisfactory cork substitute has been found, although the wood of some trees possessing a cellular sponginess, lightness, and elasticity has been substituted in many of its uses. One such, known as cordewood or alligator apple, grows in the West Indies. Rubber is used to a great extent for bottle stoppers, and many patent devices and compositions have been employed, but none are the equal of the cork stopper for general use.

DOMESTIC PRODUCTION.

Raw material.—No cork for industrial purposes is grown in the United States. The culture was attempted here as early as 1858, but was not vigorously prosecuted. It is now being introduced experimentally at Chico, Calif., by the Bureau of Plant Industry, and in Florida, by the United States Forestry Service.

With relation to these experiments, the Bureau of Forestry in a report dated March 29, 1916, states:

The cork oak is adapted to growing in certain portions of this country, notably portions of California, Florida, and the Gulf States. It does not thrive in a climate where the minimum temperature goes below 21° F. and where the maximum exceeds 104° F. The cork oak requires a porous, fairly moist soil and an annual precipitation of at least 20 inches. In western Florida, on the Choctowhatchee division of the Florida national forest, some of the trees grown from seed sown in the spring of 1911 are now 10 feet tall and very thrifty. They are, however, on fairly good soil which was thoroughly plowed and which was formerly used as a garden patch. The very largest of the trees have received some fertilizers. At slightly higher and drier elevations in the sandhills the trees have not prospered, and it seems evident that a moist and somewhat richer soil than this pure sand is necessary for their satisfactory development.

Manufactures.—Lacking a native supply, all the bark used in the domestic cork industry is imported. Domestic manufactures embrace practically all the products of cork, with the possible exception of cork paper. This was formerly produced here, but is now practically all imported. The chief products are cork stoppers (generally known as corks), disks and wafers used in the crown cork, and cork board and insulation from the waste or shavings.

Processes.—Before shipping, the slabs as cut from the trees are dried for a few days and are then steamed or placed in boiling water. This process enables the useless outer coating to be scraped off, increases their bulk and elasticity, and removes the tannic acid. It is next scraped, by which process it loses about 20 per cent in weight, then cut into proper sized pieces for baling, and sorted into numerous grades of quality and thickness. After sorting it is baled, rendered compact under pressure, and each bale marked as to quality.

Bottle corks.—Corks are made both straight and tapered and in a great variety of sizes. The thickness of a piece of bark determines the maximum diameter of the stopper, as the cutting is done across the grain. The baled bark is first re-sorted, an average bale of 180 pounds being sorted into about 4 thicknesses of wood and 4 grades, or a total of 16 kinds of wood. The importance of sorting can not be overemphasized, since the whole problem of successful and economical manufacture centers about it. The wood is steamed in ovens for about 15 minutes to soften it for working, and then sliced into strips by a revolving disk. The width of these strips determines the length of the corks. The slices or strips are then taken to punching machines where the corks are cut out, either by automatic machines or by hand punches. The "punch" is a sharp revolving hollow cylinder of the required diameter. The hand punches are more desirable for high-grade corks, as the workmen can avoid the defects in each piece of cork, whereas the automatic machines punch equal spaces in each strip, regardless of defects. For tapered corks a further step is required—placing the corks in slots which are pressed against a revolving disk at such an angle that one revolution of the cork against the disk gives the proper taper. The corks are then sorted, polished, and bleached.

As will be seen, a great deal of waste is incidental to the making of corks, and this is utilized in various ways for making articles of cork composition or for loose insulation.

Cork disks or wafers.—Cork disks or wafers, used primarily in crown corks, and to a small extent for other purposes, are made both from the natural cork and from cork shavings or waste, the domestic product being chiefly the latter. For composition disks

a good quality of waste is used. It is ground, and carefully cleaned by friction and air blast to remove all dust and defective cork wood, then mixed with a binder of rosin, glycerine, and other materials, compressed in tubes the desired diameter, and baked at low heat, great care being taken not to char the cork. The tube is then cooled and the composition as it is pressed out cut into disks about an eighth of an inch thick by automatic machinery. The disks are then sorted and packed.

The natural cork disks are made in an entirely different manner. Good quality bark is cut into strips about twice the desired diameter of the disks and the rough outer bark ripped off. It is then split into narrow strips of the finished thickness and the disks punched out by machinery.

Cork insulation board.—This also is a product manufactured from the waste incurred in the manufacture of corks and other articles cut from natural bark. The waste is ground or macerated and sifted through screens of different sized meshes. The larger granules are used for insulation board and the smaller, some of which are further ground, used in the production of cork floor tiles, composition cork disks, and in powdered form for linoleum.

The ground cork is compressed in molds and baked at 400° F. for four or five hours. The pure ground cork only may be used, the natural gum or resin serving as a binder, or a foreign binder, such as glue, asphalt, pitch, or cement, may be used. The sheets are removed from the mold, trimmed, and cut into standard sizes, 1 foot by 3 feet, with thicknesses of 2, 3, or 4 inches.

Sorting.—One of the most important as well as expensive single items in the industry is that of sorting, both of the bark and of the finished articles. The bark is very carefully sorted to obtain the better grades for the higher quality corks, but even so, it is not possible to obtain a finished article of uniform quality. Therefore, in order to make a specified number of a particular quality of corks, it is necessary to manufacture a great many of other qualities, which necessitates the careful sorting of the finished products. The same applies to cork paper and other products.

Cork paper.—For cork paper the finest quality of bark is selected, cut into blocks 3 by 6 inches, and the rough front and back faces ripped off. The block is then glued fast to a steel plate and placed in the cutting machine, which cuts the bark into sheets about $\frac{1}{300}$ of an inch thick. The sheets are then carefully stacked, ground to uniform sizes, and very carefully sorted into grades. Practically all cork paper produced is used for cigarette tips, and very little, if any, is now made in this country. The cost to the cigarette manufacture is from 9 to 20 cents per thousand tips.

Organization.—The census of manufactures for 1914 gives the value of cork cutting products as $7,875,000, as compared with $5,940,000 in 1909, and $4,491,000 in 1904. The average number of wage earners was 3,454, of whom 2,051 were male and 1,345 female, a total of 155 being under 16 years of age; 52 establishments were engaged in the industry, with capitalization of $7,602,000 and wages of $1,582,000. New York, New Jersey, and Pennsylvania are the leading States.

Hand cutting has entirely disappeared here, automatic machinery or combined hand and machine work having entirely supplanted it.

64912—21—N-6——2

Female help is being largely employed on the automatic machines where great skill is not required. Some of the work, however, requires skilled labor, such as the punching of the higher-grade corks, where male operatives feed the punches by hand in order to utilize the best portions of the bark. Practically all the machinery is of American origin and make, but has been adopted by the cork makers of foreign countries.

Some of the American firms also maintain factories in Spain, importing their products to this country.

EXPORTS.

Exports of domestic manufactures have shown a steady increase except in 1915, when they dropped to $211,765 from $462,199 for 1914. They reached $1,081,537 in 1919, and $2,002,174 for the calendar year 1920. Canada, Mexico, Cuba, and Panama are the chief buyers. Japan and the countries of South America are also important markets. Statistics are not available as to the specific articles which compose these exports.

FOREIGN PRODUCTION.

The area over which cork culture extends is approximately as follows: Portugal, 1,482,000 acres; France and her African possessions, 1,633,331 acres, of which 1,052,556 are in Algeria and 202,622 in Tunis; Spain, 741,300 acres. Italy was formerly a large grower of cork, but the production has greatly decreased through lack of culture and destruction of the cork-oak forests.

Portugal is the leading producer, growing about one-third of the world's supply. Practically all of this is exported unmanufactured.

Spain is second in production, but, unlike Portugal, exports only a small amount of the unmanufactured bark—about 18 per cent of production, as compared with exports of about 70 per cent of her manufactures of cork. She is also a large importer of unmanufactured bark from Algeria, France, Morocco, and Portugal. The industry affords employment to about 30,000 people, and modern machinery is used to a very large extent. A number of factories are maintained in Spain by foreign corporations for the production of articles chiefly for export to their home countries. In 1919 Spain imported 3,813,409 pounds of crude cork and produced 176,000,000 pounds of manufactured products, of which 102,197,609 pounds, valued at $7,514,579, was exported.[1] The chief countries of export are the United States, France, and Argentina. England and France are also large manufacturers of cork products, England being a large exporter of crown corks.

IMPORTS.

Cork bark and waste are imported principally from Portugal, that country furnishing more than half the total. Practically all the remainder comes from France, Spain, and French Africa. Imports from France consist principally of waste. In 1920 the total imports of unmanufactured cork were 223,477,340 pounds, valued at $6,338,330, of which 169,549,364 pounds, with a value of $3,741,730,

[1] Commerce Reports, No. 302, Dec. 24, 1920.

was waste, refuse, or shavings, the remainder being natural cork. Very little cork cut into squares, cubes, or quarters was imported. The value of manufactured imports was $1,969,203. The chief items were disks three-sixteenths inch or less in diameter, $905,429; cork insulation in slabs, boards, or planks, $771, 123: cork paper, $62,560; corks less than three-fourths inch in diameter, $88,509; over three-fourths inch in diameter, $39,504. The largest increase is shown for cork insulation, this total having been reached from a value of only $201 in 1914.

The imports of corks over three-fourths inch in diameter decreased to the above figure from a total of more than $2,000,000 in 1913, the drop being most abrupt in 1914, although the rate of duty was reduced that year. The decrease is primarily due to the vastly increased use of the domestic tapered cork and the crown cork. The straight cork was made in only a few sizes and, therefore, these sizes could be imported in large quantities to meet all demands. With the tapered cork this is different, as it is made in numerous qualities and many different sizes.

The decided decrease in imports of cork disks three-sixteenths of an inch or less in thickness for 1919 and 1920 is due to the increased use of the composition disk and the prohibition on brewing beer. The bottlers of beer were the chief users of the imported disk, preferring the 1-piece disk to that made of composition.

These imports are almost entirely from Spain, with the exception of 1919 when imports from Canada were considerable.

The proportion of imports which are made by American owned factories in Spain is not known.

TARIFF HISTORY.

Under the act of 1883 all manufactures of cork bark were dutiable at 25 per cent ad valorem; the act of 1890 divided the manufactures into bark cut into squares and cubes, dutiable at 10 cents per pound, and manufactured corks, dutiable at 15 cents per pound; by the act of 1894 corks, wholly or partially manufactured, were dutiable at 10 cents per pound, bark cut into squares or cubes not being specially provided for; the act of 1897, however, included bark cut into squares or cubes, making them dutiable at 8 cents per pound, and divided the classification of corks into corks over three-fourths of an inch in diameter at the larger end, 15 cents per pound, and corks three-fourths of an inch or less in diameter at the larger end, 25 cents per pound. These duties remained the same in the act of 1909, and at the present are, cubes, squares, or quarters, 4 cents per pound; corks over three-fourths of an inch in diameter, 12 cents per pound; three-fourths of an inch or under, 15 cents per pound.

Artificial cork or cork substitute manufactured from cork waste or granulated corks was first included in the act of 1897 at 8 cents per pound; it was reduced to 6 cents per pound in 1909, and at present is dutiable at 3 cents per pound.

Manufactures of cork not specially provided for, under the act of 1894 were dutiable at 25 per cent ad valorem; and at the same rate under the act of 1897. In 1909 the designation was broadened to include manufactures of artificial cork or cork substitutes not spe-

cially provided for, and the duty increased to 30 per cent ad valorem. Under the present act the duty is 30 per cent ad valorem.

Unmanufactured cork wood or bark has been free under all acts.

The act of 1913 included several new classifications; cork disks, wafers, or washers three-sixteenths of an inch or less in thickness, 15 cents per pound; three-sixteenths of an inch in thickness 12 cents per pound; cork insulation, one-fourth cent per pound; cork paper, 35 per cent ad valorem.

COMPETITIVE CONDITIONS.

Spain is the country whose competition is most keenly felt. The initial advantage possessed through its native supply of raw material is augmented by the imposition of an export tax on unmanufactured cork bark by both Spain and Portugal.[2] This advantage is intensified when tax and freight costs are considered in connection with the large percentage of waste in cork bark. This is not compensated for by the utilization of cork waste, as the freight rate on cork bark is much higher than that on cork waste.[3] The American manufacturer, therefore, who is engaged only in the cutting of cork is at a disadvantage in disposing of this waste.

In the tariff hearings of 1913 it was stated that the labor costs in Spain were about one-third those here. Later information furnished by the trade indicate that this difference is now greater, as the wages in Spain have not increased equally with domestic increases.[4] Cork cutting having been followed by Spanish families for generations, the Spanish workman is very efficient, some manufacturers stating that the skilled Spanish cutters are superior to the American workmen. Modern machinery is used, and production is as efficient as here at a less cost of labor and material.

The products most affected are cork paper, cork disks, such articles as seine floats, cork for life preservers, and cork insulation board. Practically no cork paper, seine floats, life-preserver cork, etc., are produced in this country because of inability to meet this competition; but composition cork disks made in this country compete with natural cork disks.

Cork—Rates of duty.

Act of—	Par.	Tariff classification or description.	Rates of duty, specific and ad valorem.
1883....	422	Corks and cork bark, manufactured	25 per cent ad valorem.
	683	Cork wood, or cork bark, unmanufactured	Free.
1890....	434	Cork bark, cut into squares or cubes; manufactured corks	10 cents per pound; 15 cents per pound.
	548	Cork wood, or cork bark, unmanufactured	Free.
	369	Cork carpets, figured or plain, * * * valued at 25 cents or less per square yard; valued above 25 cents per square yard.	40 per cent ad valorem. 15 per cent per square yard and 30 per cent ad valorem.
1894....	319	Corks, wholly or partially manufactured	10 cents per pound.
	351	Manufactures of * * * cork * * * or of which these substances or either of them is the component material of chief value, not specially provided for * * *.	25 per cent ad valorem.
	457	Cork wood, or cork bark, unmanufactured	Free.
	273	Cork carpets, figured or plain, * * * valued at 25 cents or less per square yard; valued above 25 cents per square yard.	25 per cent ad valorem. 40 per cent ad valorem.
1897....	416	Cork bark, cut into squares or cubes, manufactured corks over ¾ of an inch in diameter measured at larger end, ½ of an inch and less in diameter, measured at larger end; cork, artificial or cork substitutes, manufactured from cork waste and not otherwise provided for.	8 cents per pound. 15 cents per pound. 25 cents per pound. 8 cents per pound.
	536	Cork wood, or cork bark, unmanufactured	Free.
	337	Cork carpets	20 cents per square yard and 20 per cent ad valorem.
	448	Manufactures of cork or of which these substances or either of them is the component material of chief value.	25 per cent ad valorem.
1909....	429	Cork bark, cut into squares, cubes, or quarters	8 cents per pound.
		Manufactured corks, over three-fourths of an inch in diameter, measured at larger end.	15 cents per pound.
		Three-fourths of an inch and less in diameter, measured at larger end.	25 cents per pound.
		Cork, artificial, or cork substitutes, manufactured from cork waste or granulated cork, and not otherwise provided for.	6 cents per pound.
		Manufactures, wholly or in chief value of cork, or of cork bark, or of artificial cork or cork substitutes, granulated or ground cork, not specially provided for.	30 per cent ad valorem.
	547	Cork wood, or cork bark, unmanufactured	Free.
	347	Cork carpets	20 per cent per square yard and 20 per cent ad valorem.
1913....	340	Cork bark, cut into squares, cubes, or quarters	4 cents per pound.
		Manufactured cork stoppers, over three-fourths of an inch in diameter, measured at the larger end, and manufactured cork disks, wafers, or washers over three-sixteenths of an inch in thickness.	12 cents per pound.
		Manufactured cork stoppers, three-fourths of an inch or less in diameter, measured at the larger end, and manufactured cork disks, wafers, or washers, three-sixteenths of an inch or less in thickness.	15 cents per pound.
		Cork, artificial, or cork substitutes, manufactured from cork waste, or granulated corks, and not otherwise provided for.	3 cents per pound.
		Cork insulation, wholly or in chief value of granulated cork, in slabs, boards, planks, or molded forms.	½ cent per pound.
		Cork paper	35 per cent ad valorem.
		Manufactures wholly or in chief value of cork or of cork bark, or of artificial cork or bark substitutes, granulated or ground cork, not specially provided for.	30 per cent ad valorem.
	276	* * * Cork carpet, figured or plain, cork carpet rugs or mats	30 per cent ad valorem.
	464	Cork wood, or cork bark, unmanufactured, and cork waste, shavings, and cork refuse of all kinds.	Free.

COURT AND TREASURY DECISIONS.

[Under tariff act of Oct. 3, 1913.]

Disks less than $\frac{3}{16}$ of an inch in thickness made of granulated cork and a binding material, used for inside lining for bottle caps, cans, and for gaskets, are dutiable as manufactured cork disks at 15 cents per pound under paragraph 340. (In re Frankel Co., G. A. 7707, T. D. 35270, of 1915.)

Cork boards or slabs, manufactured from cork shavings, designed for use as floor tiling, are subject to duty at 30 per cent ad valorem

under the provision in paragraph 340 for "manufactures wholly or in chief value of cork * * * or ground cork, not specially provided for." (In re Knauth, Nachod & Kuhns, G. A. 8240, T. D. 37953, of 1919, overruling G. A. 7921, T. D. 36541.)

So-called cork waste, consisting of disks known as "throw outs" mixed with cork cuttings, broken disks, etc., are admitted free of duty under paragraph 464 and not charged with duty under paragraph 340. (T. D. 36214, 36303, and 36579, of 1916.)

So-called cigarette paper, otherwise known as cork paper, in bobbins, or cork bobbins, consisting of thin sheets or strips of cork backed with tissue paper, varying in width from about ½ of 1 inch to 4½ inches and in lengths of about 300 meters, is dutiable at 35 per cent ad valorem as cork paper under paragraph 340. (T. D. 37196, of 1917.)

MISCELLANEOUS.

A bale of cork weighs 150 to 225 pounds. Baled cork wood runs 250 cubic feet to the short ton; cork waste about 165 cubic feet to the ton; cork boards about 210 cubic feet to the ton.

List No. 2 of restricted imports of May 13, 1918, as reported by the United States War Trade Board.

Cork manufactured and manufactures thereof.—Licenses for cork unmanufactured and manufactures of will be granted only as return cargo from European countries, and then only when shipped from a convenient port and when loaded without undue delay.

Export tax.—Spain: 5 pesetas per 100 kilos ($0.965 on 220 pounds). Portugal: Cork wood, or in sheets, 0.03 milreis per 15 kilos (equals $6\frac{1}{15}$ cents per 100 pounds); manufactured in blocks, 0.100 milreis per 15 kilos (equals 21 cents per 100 pounds).

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this, industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act, reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and Index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and Index," the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Charles F. Yauch, of the Commission's staff, and of others.

BRISTLES AND BRUSHES.

BRISTLES.

SUMMARY.

Uses.—Bristle is obtained from the backs and sides of hogs and requires several years of growth to become sufficiently strong and stiff. It is the most satisfactory material for the manufacture of paint and toilet brushes and is little used for any other purpose. Inferior grades are in demand as stuffing for mattresses and for upholstery. As the value of bristle for toilet brushes is proportionate to its stiffness, the heavy or follicle end is preferred. For paint brushes the uncut bristle is used because the split end, called the "flag," lifts the paint more readily.

Substitutes.—No material has been found which combines the characteristics of stiffness, durability, and resiliency as does bristle. Horsehair, split quills, tampico, and other fibers are mixed with or used in place of bristle, but with inferior results.

Countries of greatest production.—The best bristle is obtained from hogs which thrive in cold countries. The finest quality comes from northern Russia and Siberia. China ranks first in the quantity of bristle exported, but as the quality is not equal to that of the Russian product, it is second in value. These two countries furnish the larger portion of the world's supply. Small amounts are obtained from India, France, and Rumania. Statistics of production in foreign countries are not available.

Revenue.—The duty on prepared bristles has always been specific. Since 1894 there has been but one change in the rate, a reduction from 7½ cents per pound to 7 cents under the tariff act of 1913. As the annual imports of bristles varied but slightly during this period, the amount of revenue derived yearly was almost constant, averaging about $250,000. The imports showed a marked increase for 1917 and the revenue was over $300,000.

Suggestions of manufacturers as to tariff classification.—Brush manufacturers seek the removal of the duty on bristles or at least a reduction. They justify their position on the following grounds:

1. Foreign manufacturers pay no duty on bristles besides having the advantage of cheap labor. The free importation of bristles would put the American manufacturers on a more equal basis with their competitors.

2. Bristles vary greatly in value. The specific duty ranges from 3 to 45 per cent of the value of the bristle. Cheap bristles are imported in larger quantities than the more expensive.

3. Bristles are not an American product, therefore the removal of the duty would not injure an American industry.

4. Revenue derived from bristle imports is relatively insignificant, therefore the loss to the Government would be slight.

Those interested in the bristle-dressing industry argue that the removal of the duty on bristles would so slightly affect the cost of each brush that there would result no benefit to the consumer or the brush factory employee; but, on the other hand, it would work great hardship on the bristle dresser.

Bristles, sorted, bunched, or prepared—Summary table.

General Information.

1913 tariff paragraphs:

"337. Bristles, sorted, bunched, or prepared, 7 cents per pound."

"432. Bristles, crude, not sorted, bunched, or prepared. Free."

Description and uses.—Bristle is the stiff, coarse hair of the swine. The strongest and best grows along the spine and commands a higher price than the softer "side" bristle. The quality is very variable, depending upon the season, the climate, and the breed and maturity of the hog. Even the bristles procured from a single hog at one time will not be uniform in quality. As the use of bristle is practically limited to the manufacture of brushes, it is graded according to its

serviceability for this purpose. Color is often a factor in determining price, but stiffness, resiliency, and length are requisite for success in brush making. The color varies from white to black with intermediate shades of gray and sometimes bronze. White bristle is usually more costly because of the greater demand, but it is not necessarily superior in quality. Stiffness and resiliency make bristle peculiarly valuable for paint brushes, the one insuring durability, the other rapid and accurate response to the touch of the workman. Because of its structure, bristle is better adapted than any other material to paint-brush manufacture. It is heaviest at the follicle end, tapering slightly toward the opposite end, called the "flag" because of tiny splits or divisions. This tapering causes the bristles, when properly inserted in the brush, to cling together and thereby to apply the paint without streaking. The flag ends make the brush more absorbent; it holds the paint on the brush, and it causes an even flow of the liquid to be distributed. For these reasons bristles in paint brushes are uncut and different lengths are used to insure the presence of flag ends when the longer bristles have worn down. Russian bristle has a more decided flag than any other, and because of the heavy body, continues to split with use. Varieties of bristle average different lengths; the Russian ranges from 3½ to 7 inches, the French from 2 to 4⅞ inches, and the Chinese from 2½ to 7 inches. A further characteristic which renders bristle invaluable as a paint-distributing medium is its "life," a quality dependent on its cellular formation containing natural oils which give it an affinity for paint.

Bristle is equally the material of prime importance in the toilet-brush industry, though its efficacy in this line does not depend upon the same characteristics. Stiffness, flexibility, and elasticity are as necessary in the toilet brush as in the paint brush, but the flag end is worthless. Long bristle is desirable because the stiffness increases in proportion to the length. The heavy butt end, however, is the choice part and cheaper grades of brushes are made from the tapering portion between this and the soft end.

When the manufacturers receive the bristle it is in bunches from 2 to 12 inches in diameter, tied around with twine or bark, and sometimes wrapped in paper bearing the brand. These bunches come packed in cases or casks containing an assortment of many grades and lengths.

Kinds.—Commercially, bristle admits of a varied classification. It is listed according to the locality from which it comes, as "Tientsin," "Hankow," "Calcutta." These groupings are subdivided to designate particular characteristics, such as color, length, quality.

Substitutes.—There is no perfect substitute for bristle. Other materials, especially horsehair, tampico, and split quills, are sometimes used in place of bristle, but they cheapen the quality of the brush, lessen its effectiveness and durability. The characteristics which render bristle the most satisfactory material for brushes are not combined in any one substitute.

Hair obtained from the manes and tails of horses and from cows' tails is most frequently used as an adulterant in paint brushes. Some is imported, but much is obtained in this country, chiefly in Texas, and it is considerably cheaper than bristle. A horsehair paint brush is inferior for several reasons: It has no flag ends, so does not lift the paint easily; it does not taper; and it has not the life and elasticity which make the bristle paint brush a perfect tool. The

diameters of the follicle end and the flag end of bristle may vary 0.018 to 0.033 part of an inch, whereas horsehair does not taper over 0.004 part of an inch. A brush containing horsehair has not the durability of a pure bristle brush and, in the paint, will soon become flabby and useless. For certain kinds of brushes horsehair is the most desirable material.

Tampico fiber, a grass imported from Mexico and South America, is a substitute even cheaper than horsehair. In the manufacture of hair and other toilet brushes put on the market at a very low price, tampico is frequently used with bristle. It is coarse and stiff but, lacking the life and resiliency of bristle, it wears out much more rapidly. In fact, it is too coarse and stiff to be a satisfactory medium for applying paint. It has very much the appearance of bristles. A manufacturer declared it is difficult to distinguish without test by fire, consequently it is easily used as an adulterant. Floor sweeps, counter dusters, scrub and other household brushes are satisfactorily made with it.

Among other substitutes for bristle, split quills from feathers, carefully tapered and prepared, have been tried but with little success.

Various kinds of hair, particularly squirrel and sable, are used in the manufacture of artists' brushes for which bristle is not well adapted.

Production.—Climatic conditions are apparently the most potent factor in determining the quality of bristles which hogs produce. The finest quality of bristle, like fine fur, comes from countries lying in the cold belts, where nature provides more sufficient covering for the beasts, and where the beasts themselves thrive in a wild or half-wild state. It is a curious fact that the bristle production of a hog is inversely proportionate to its value as pork. This is the case not only because hogs, slaughtered for the meat, are not allowed to attain sufficient maturity for the bristle to be of much value, but also because with breeding for pork the quality and quantity of bristles tend to diminish. The finest varieties, such as Yorkshire and Hampshire, are practically hairless. "The thinner the hog, the better the bristle" is almost an axiom among bristle dealers.

Countries of greatest production.—The actual production of bristle seems to be almost entirely fortuitous. Nowhere in the world, except to a limited extent in Germany and France, are hogs raised primarily for bristle, or bred to produce greater quantity or better quality. In normal times Russia, by the very fact that her territory embraces the greatest frigid area under one Government, is the main source of the world's supply of extra fine bristle. In prewar times Germany figured as a large exporter, a fact not indicative of great production in that country, for Russian stocks were marketed by German merchants. The remainder of the world's supply, small in proportion to the total outpu of the above-named countries, comes from various localities, among which France, Rumania, and India are ranked as most important.

In so far as figures from different sources are comparable, China exceeds Russia in quantity of production, but as the superior quality of Russian bristle commands a higher price, Russia takes first place in value of exports.

The Chinese bristle trade is almost entirely with Great Britain, France, the United States, and of late years, Japan, as is shown by the table of percentages for the five years 1912 to 1916. The total

trade for this period averaged 7,250,087 pounds annually; this average was considerably exceeded by the exports of 1916 which amounted to 8,371,600 pounds. Although the United States received larger quantities of bristle from China during 1914, 1915, and 1916, there has been little fluctuation in the proportion of trade with this country; the United Kingdom and Japan took the greater part of the increased exports.

The average supply of Indian bristle called "Calcuttas" amounts to somewhat less than half a million pounds annually, which is exported almost entirely to the United Kingdom. It is impossible to estimate the total exports from France, as French statistics include bristles with other brush-makers' wares.

The bristle industry in Russia.—The very finest grades come from Siberia, from the region between the Ural Mountains and the Lena River. The manner in which bristle is collected is characteristic of the necessitated thrift practiced by European and Asiatic peasants. They not only save the bristles from the slaughtered hogs, but gather in the forests those shed by the animals especially during spring. They can not afford to feed the hogs and pork is quite a luxury; hence the bristles grow long and coarse and strong.

As the means of transportation to isolated villages, scattered over the vast plain, are even yet inadequate, the bristle is hoarded by the peasants until the coming of some itinerant purchaser, perhaps a peddler who barters for the goods. From the peddlers it is passed on to the dealers located in the principal centers, such as Petropavlovsk, Omsk, Navonikolaievsk, and Barnaul in Siberia. The preparation of the bristle is not done in Siberia. It is shipped in a raw state to European Russia, where the peasants of the north sort, straighten, turn, drag, and grade it. Establishments for this work have been opened at Nizhni Novgorod, Vyatka, Kharof, and Saratof.

Russian bristle markets.—Often not more than 200 pounds are obtained annually from a village, but from these small beginnings large stocks of raw and prepared bristle are assembled together with other commodities at the fairs, which, because of the difficulties of travel, are so important to the commercial life of Russia. Much of the Siberian bristle is disposed of at Irbit, where a fair is held each year in February. The fair at Nizhni Novgorod, held annually from the last week in July until the middle of September, is the most famous. It is the collecting center for northeastern Russia and Siberia and is attended by bristle buyers from all parts of the world. In 1916 the quantity of bristle brought to the fair amounted to about 180,000 pounds, which was disposed of at varying prices, ranging from 41 to 82 cents a pound for ordinary bristle to as high as $2 a pound for selected grades.[1]

Soon after the beginning of hostilities, Russian bristle dealers, considering Petrograd an advantageous center for the establishment of a permanent market for Russian bristle because of existing lines of communication to the principal countries of destination, made tentative plans in that direction.[2] These plans failed to materialize as they had anticipated,[3] although exports from Petrograd show an increase.

The Commerce Report No. 140, June 16, 1917, quoting from the

[1] Commerce Reports, June 16, 1917.
[2] Commerce Reports, June 15, 1915.
[3] Brooms, brushes, and handles, March, 1918.

Weekly Bulletin, Canadian Department of Trade and Commerce, Ottawa, June 4, has this statement: "While the war put a stop to the German trade in Russian bristle, the demand for bristles from western Europe and America increased, owing to their use in Army boot brushes, etc. The Petrograd export houses at once increased their sales. Thus, in 1913, out of total exports of 5,688,000 pounds of bristles from Russia, Petrograd firms exported 288,000 pounds; in 1914, out of total exports of 3,456,000 pounds, their share was 360,000 pounds; while in 1915 they handled 1,548,000 pounds, out of total exports from Russia of 3,420,000 pounds of bristles."

The direct imports into the United States from European Russia in 1916 were more than five and one-half times the imports for 1913.

The bristle industry in China.—The best Chinese bristle comes from the northern Provinces, Manchuria and Chihli, and from central and western China. The inferior qualities of the south are not salable when the stronger and better-packed bristles from the north can be obtained.

The Canton bristle is sometimes bought up by speculators and put on the market when prices are high. For this reason bristle exports from Canton are variable. Short lengths predominate in assortments of Chinese bristle. As it is usually black and lighter weight, it does not command the price of Russian stocks in the same sizes.

The Chinese bristle industry is described by Vice Consul Crawford M. Bishop, Shanghai, in Commerce Reports, No. 140, June 16, 1915. According to this account the trade, as in Russia, originates in unorganized and sporadic collections by native dealers from the rural population. These stocks are received in a raw state at the larger centers, where they are cleaned, boiled, assorted, and dressed. The preparation of Chungking bristle, for which a certain superiority is claimed, is given in detail as follows: "Chungking bristles are delivered in small bundles, each generally containing the bristles of one pig, and are placed in a 'kong,' or water jar, and kept there in water for one week. The bristles are then washed, cleaned by combing, and spread out in flat baskets and dried in the sun, mostly on the roofs of godowns or houses. The dried bristles are tied on small flat wooden sticks by women and steamed for two or three hours. Then, after removal from the sticks, they are assorted according to length, cleaned again by combing, and bundled.

"To clean 100 piculs (picul = 133⅓ pounds) of bristles 240 men or women are needed. The work of the women consists in tying the bristles on the sticks and in taking them off. Later they receive the finished bundle and pick out all gray or diseased bristles and also the few white ones that may have been overlooked. All other work is done by men, who are paid monthly. The Shanghai and Hankow bristles are cleaned differently and are, therefore, not so straight nor so brilliantly dark in color."

Chinese bristle markets. The principal centers of the bristle trade in China in the order of their importance are Tientsin, Chungking, Hankow, Kowloon, and Shanghai. Tientsin is a northern port in the bristle-producing district and ships annually an average of about 2,500,000 pounds. In the interior Chungking and Hankow, river ports on the Yangtze kiang, are markets for the vast area of central China, handling annually from 1,500,000 to 2,000,000 pounds each. Far less bristle is produced in southern China than in the northern

and central Provinces. Kowloon ships about a half million pounds per annum, and a larger quantity goes through Hongkong, which, not being a Chinese port, is not included in Chinese statistics.

The German bristle market.—In prewar times Leipzig was the world's greatest bristle market. German firms held a monopoly on the bristle output of Poland, western Russia, and even a large proportion of that of Siberia. Enormous bristle stocks of great variety were displayed several times a year at fairs, where American, English, and French dealers effected much of their purchasing. It has been estimated [4] that the average annual distribution of Russian and Siberian bristle at the Leipzig fairs was about 5,400,000 pounds, on which the German dealers more than quadrupled their money. On the purchase price of $2,000,000 they netted a profit of $7,000,000. They enjoyed the advantage of proximity to the source of supply, but their success is attributed to the financial strength of the German importing houses and the cheap bank credit at their command. Bristles procured by American importers through the Leipzig market amounted in value to $982,247 in 1913 and to $679,849 in 1914.[5] The value in 1915 was less than half that of the preceding year. The embargo on exports, the inability of German dealers to secure stocks from Russia, and, to some extent, the shortage of labor have so depressed the bristle market that the fairs have been discontinued.[6]

London, the English bristle market.—London is also an active bristle market. Long the point of distribution for Chinese bristle, the English city, through the cessation of the Leipzig fairs, has become a center for the Russian output as well. No statistics are available concerning the trade in London, but the imports of bristle into the United Kingdom will give a fair idea. The total imports average between five and six million pounds. In 1912 imports amounted to 4,609,047 pounds, of which China supplied 2,215,110 pounds, or 48.06 per cent, and Russia 1,043,149 pounds, or 22.63 per cent. During the first year of the war the Chinese imports were nearly doubled, reaching 4,414,933 pounds, which was 63.86 per cent of the total, whereas the Russian imports, 1,045,579 pounds, were practically the same as in 1912, but represented only 15.12 per cent of the total, which had increased to 6,913,574 pounds. The renewed activity of Petrograd exporters may have been the cause for increased imports of Russian bristle in 1916, amounting to 2,289,621 pounds, and high ocean freight rates were likely responsible for a falling off of over a million pounds in the Chinese imports, which were only 3,347,038 pounds, thus reverting to about the same relative proportions as prior to the war. The United Kingdom takes almost the entire output of India, which in comparison with the imports from China and Russia is inconsequential. Imports of Indian bristle amounted to about 432,320 pounds in 1915–16 and 396,816 pounds in 1916–17.[7] (The fiscal year ends in March.) War needs have greatly increased the demand for brushes, and both New York and Paris look to the London market for much of their supply; hence the London dealers have enjoyed exceptionally active business.

The traditional fairs held on the Continent are not customary in London; instead, the bristle is disposed of at frequent public auctions.

[6] Commerce Reports, Supplement No. 6a, 1916.
[7] Annual statement of the sea-borne trade of British India.

The American bristle market.—There is practically no American bristle on the market, as the hogs bred for pork grow rapidly as a result of feeding, and either produce no bristles or bristles that are too soft for brushes. At one time the bristle dressers had employees stationed at the large slaughterhouses to remove the bristles and send them to the bristle-dressing establishments. The work of these men has been superseded by machinery for dehairing the hogs. The result is a diminishing quantity of bristles available for brush manufacture obtained as a by-product of slaughterhouses.

This soft bristle, often called hog hair, is removed from the hog by scraping, and is a valuable commodity for stuffing mattresses and for upholstery. The hair, mixed with particles of thin outer skin detached by scraping, is cleaned, and while damp spun into ropes to curl it. The curled hair gives a more springy filling and is preferable for upholstery.[8]

New York is the bristle market for the United States, but as the imports are entirely for home consumption there is no export trade. There is no bristle exchange, nor are there public auctions. The importers sell directly to the manufacturers. Sometimes representatives of the importers negotiate sales at the factories, but often manufacturers prefer to visit New York, where they can make their choice from the stocks of different importers.

American dealers have done little buying at the sources of supply. They make their purchases through intermediate markets. Results would not justify the expense involved in sending representatives to the countries of origin, and a wider range for selection is possible at the established centers.

Imports.—The imports of bristle into the United States for the last 10 years show little variation, averaging about 3,500,000 pounds yearly. The quantities for 1908 and 1909 fell somewhat below this mark, being 2,441,726 and 2,819,524 pounds, respectively, a decrease which resulted probably from the financial stringency following unstable monetary conditions of 1907. For the first two years of the war the total imports remained normal, though there was considerable change in the sources of supply. The embargo on German trade, the decreased activity of French brush manufacturers, the demands of Great Britain for the total output of her factories, as well as the enormous brush supply required by the United States for construction and equipment in the Army and Navy, gave an unprecedented impetus to the manufacture of brushes in this country. This was reflected in the imports of bristle, which amounted in 1917 to 4,585,178 pounds, an excess of 26.85 per cent over 1916. Although crude bristle is admitted free and the prepared bristle is subject to a duty of 7 cents a pound, usually over 99 per cent of the total imports for consumption is prepared bristle. There are two probable reasons for this: (1) The wastage in buying the crude, unassorted bristle is very great, and (2) the difference in labor costs in foreign countries and the United States more than offsets the duty. In 1916 and 1917 there was a slight increase in the proportion of crude bristle imported. The three most important countries from which American dealers, in normal times, draw their supply are Germany, the United Kingdom, and China. German imports, consisting of

[8] "Brush Making," London, Nov. 20, 1917.

Russian bristle, ranked first in value, but the greatest quantity came from China. The difficulty and final impossibility of trade with Germany forced American buyers into the Chinese market. That country supplied 2,358,772 pounds, or 58.73 per cent, of the total prepared bristle in 1915 and 2,333,437 pounds, or 60.61 per cent, of the total in 1916.

Effects of the war on the bristle industry.—The war has caused considerable disturbance in the bristle industry. It has closed the Leipzig market through the embargo on German exports; it has made the Russian supply uncertain; it has increased ocean freight rates and made shipping exceedingly precarious; and, on the other hand, it has enormously increased the demand for brushes in belligerent countries. The first condition had the result of unsettling the market for awhile, but as Germany was not an important source of supply, a gradual readjustment led to a transfer of activity in the bristle trade to London. Another difficulty has arisen in this regard by the action of the British Government prohibiting exportation of bristles. The chaotic conditions in Russia have proved a serious handicap to bristle dealers and brush manufacturers. The finest grades of bristle come from Russia, and these are practically unobtainable. China has, as a consequence, become the main source of supply, but even in that country political disturbance, floods, and plague have militated against prompt or certain delivery. The sinking of cargoes and the appalling scarcity of available tonnage have made the movement of bristle to manufacturing countries increasingly difficult. The short transportation from China to Japan has enabled the latter country to take advantage of the situation. The phenomenal rise in the quantities of Chinese bristle consumed by Japanese brush manufacturers after the elimination of European competition is indicative of their enterprise. In 1912 and 1913 but little over 2½ per cent of the bristle exported from China went to Japan; in 1914, 8.76 per cent; in 1915, 10.86 per cent; in 1916, 18.33 per cent, which represented 1,533,933 pounds, or almost eight times as much as in 1913.[9] The westward extension of Japan's sphere of influence is regarded as having particular weight in the bristle trade, as it would enable her to dominate not only the Chinese markets but the Siberian output as well.

There has been some increase in the quantities imported by the two greatest manufacturing countries—Great Britain and the United States—but the most marked difference caused by the war has been the shifting of trade from Germany, and, in the case of Great Britain, from Russia to China. In 1916 over 60 per cent of the total imports of bristle into the United States came directly from China. During the same time Chinese bristle comprised over 50 per cent of the total amount received by Great Britain. All these difficulties created by war conditions have led to the inevitable result—high prices.

Even before the war, in 1913, a committee on brushes reported to the convention of the National Paint, Oil, and Varnish Association that, owing to the increase in population, the construction of enormous buildings and ships, and the extension of requirements for brushes, the supply of bristles was not equal to the demand. Under

[9] From figures in Official Chinese Trade Reports.

normal conditions, therefore, the tendency was toward higher prices; the war, affecting the countries of origin, means of transportation, rates of exchange, and various other phases of the trade, enormously accelerated this tendency. The prices on some grades advanced 300 per cent over prewar quotations. The value per unit of quantity of bristles imported into the United States has been comparatively constant, having fluctuated only 25 cents during the 11 years 1907–1917. This apparent discrepancy is accounted for by the fact that later importations comprise a higher percentage of Chinese bristle, which is much cheaper than the Russian.

THE BRUSH INDUSTRY.

"PAR. 336. * * * brushes and feather dusters of all kinds, and hair pencils in quills or otherwise, 35 per centum ad valorem."

TRADE AND COMPETITION.

Competition is keen among domestic manufacturers of brushes, as there is no association to regulate the trade. The industry has profited by the partial elimination, during the war, of European competition and by the large orders for brushes by the Government, the Red Cross, and foreign countries whose trade before the war was supplied by the brush-producing countries of Europe.

Official statistics do not show the quantity, kinds, or grades of brushes imported; the information herein given in regard to the character of foreign competition is therefore largely from statements of manufacturers, importers, and dealers.

Beginning with July 1, 1918, the following classification is followed in official statistics: Toilet brushes comprising tooth, hair, nail, or hand; all other brushes; feather dusters; and hair pencils.

Toilet brushes.—Foreign competition in the past has been almost entirely on toilet brushes. It has been estimated that from 50 to 60 per cent of the toilet brushes used in the United States are imported.

The following statements were made at the conference of the United States Tariff Commission with representatives of the brush industry, held in New York City, March 25–26, 1918.

Before the Ways and Means Committee some years ago the statement was made to me, "There are eleven or twelve million dollars worth of brushes manufactured in this country, and you only import two or three million?" Take the paintbrush industry away and what do you find? You find that we barely make 40 per cent of the toilet brushes used in the country and that the other 60 per cent is supplied from abroad.

The toilet-brush industry battles with labor and conditions in Japan and Europe, which dwarfed its development in this country to such a degree that the industry is practically given over to special lines only, as none of us can make a full line of toilet brushes, whether hair, tooth, or other shapes, against the keen competition that we meet here. (From the statement of Mr. H. Alexander, of the Henry L. Hughes Co., manufacturers.)

In normal times I think over 50 per cent of the toilet brushes used in this country are made in Europe and Asia. (From the statement of Mr. William Cordes, of the Florence Manufacturing Co.)

Importers, on the other hand, claim that they encounter strong competition from domestic manufacturers of toilet brushes.

I wish to differ with some of the testimony already given to the effect that the importers do 60 per cent of the total business of toilet brushes, leaving 40 per cent for the domestic makers.

The tariff on importations of sorted bristles is 7 cents a pound. So much per pound, and for that reason a man can import bristle and put it into a paintbrush or into a hairbrush, where the handle is of little value, much cheaper than he can import the finished article and pay a 35 per cent duty on it, and that is the reason that the domestic paintbrush makers and the hairbrush makers have the largest part of the business. The business left to the importers, as has been stated, is the toothbrush business and the better grade of hairbrushes, hand drawn.

In Japan prices have gone consistently up since the beginning of the war, partly due to the increased cost of labor and partly to the increased cost of raw material, and to a certain extent on account of the buying of other markets, such as South America, London, Australia, and New Zealand, which markets were not chiefly supplied by Japan before the war. We find they are paying prices constantly which are hard to obtain in this market, and at times it has been difficult to obtain supplies in quantities sufficient to meet the demand here for that reason.

We are perhaps a little jealous of the position of American makers. Through advertising done extremely well they have developed trade-marks of value which really place their product beyond price competition. We would like to be in that position ourselves, but unfortunately we are not.

Foreign competition after the war is overestimated. The scarcity of bristles in every brush-producing nation will prevent any accumulation of stock to be dumped here. The countries of Europe are fighting with every man who is able to stand on his feet. They are cut off from their source of supply of raw material; they are disorganized and lack capital to increase their production rapidly. Their prices have been and will be constantly advancing much faster than here. Profits may be cut out a little, but if the production is small it will have but little effect on conditions here for some years after peace is declared. (From the statement of Mr. W. B. Gibson, importer.)

On the cheaper grades of hairbrushes we can not complete. The United States Government, in buying goods for the soldiers, buys domestic hairbrushes, and we can not quote them anything as good at as low a figure. The United States Navy buys military brushes made in this country, and we are unable to quote on those brushes. We can not meet the domestic prices. The only business we can get from the Government is the toothbrush business. The Government requires a low-priced brush, something that sells for about 10 cents apiece. This is all the soldiers can afford to pay for toothbrushes in the cantonments, and that is the only business we can get. (From the statement of Mr. G. S. Gibson, importer.)

The brush business * * * is largely controlled in the United States by the domestic manufacturers, with the exception of the toothbrush industry.

The domestic manufacturers will bring up the argument that they are unable to compete with the French article on account of the price. But in the course of their production they make use of a great many demonstrations. For instance, they will go to a department store and they will put into that department store a demonstrator or a sales person, which costs them so much per week, and that must be taken into account in considering the cost of production of the brush. (From the statement of Mr. Louis d'Angelo, of the Cauvigny Co.)

I believe the main point to be brought out is whether or not the domestic brushes can compete with the foreign-made article. I maintain that they can. My experience has been that when we submit (to Japanese manufacturers) a cement-faced brush, an aluminum-faced brush, a porcelain-faced brush, a two-piece wire-drawn brush, or a solid-backed machine-made brush, we invariably receive a reply that nothing can be done on that class of goods. That takes in bath, hair, nail, hat, and cloth brushes. (From the statement of Mr. O. Zincke, importer.)

The total production of toilet brushes in the United States, according to the Federal Census of 1914, was valued at $3,312,870. The total value of all brushes imported amounted to $2,180,853 for the fiscal year 1914. The last-named amount does not represent the value of the goods laid down, duty paid, in the United States, but the actual market value or wholesale price, at the time of exportation to the United States, in the principal markets of the country whence exported. In comparing production and importation, allowance should be made for consular fees, ocean freights, marine insurance, duties, other charges, and importers' profit.

Toilet brushes, such as tooth, hair, nail, bath, cloth, hat, and shaving brushes, are imported in normal times from France, Japan, Germany, England, and Austria. The French product is noted for its artistic and graceful design and is generally of the solid-back, handmade, trepanned type. The English brush is very different from the French product in appearance. With the exception of tooth and shaving brushes, the English type is a two-piece, hand-drawn brush, the parts of which are fastened together with screws, which add to the general effect of solidity and substantial appearance. The highest grades of brushes imported come from these two countries. They largely supply a class of trade which calls for certain special English or French makes, or which simply prefers the foreign to the domestic article.

The representative of a French company made the following statement:

Aside from making the cheap goods with which we are unable to compete, domestic manufacturers also make a very fine grade of brushes. The S. E. Howard's Sons & Co. has the distinction of making as good a line as any that could be purchased in Europe. The firm of Whiting & Adams, of Boston, make the very best line of hairbrushes, without exception, that can be produced. * * *

The sale of French brushes in this country is not due to their beautiful finish, because they can make just as good a finish here, but it is due to the fact that there is a certain element of people who like to have something French and who are willing to pay the prices. (From the statement of Mr. Louis D'Angelo of the Cauvigny Co., importers.)

An American manufacturer of high-grade brushes gave the following testimony:

In normal times we have difficulty in meeting the competition of Dupont, of France, and Kent, of England; since 1914 we have had but little competition. (From the statement of Mr. W. C. Howard, manufacturer.)

Brushes imported from Germany and Austria are not, as a rule, the equal of those imported from France and England, though Austria has exported to the United States some brushes which rival the French product in style. The cheaper and medium-grade goods are supplied by Germany, where the styles of other countries are copied or imitated. Although Germany and Austria follow largely the hand system of drawing, they also produce machine-made brushes, which are exported to the United States and which come in competition with similar goods in this country. Japan's product is more or less a copy of the designs produced in other countries, and she exports many of the cheaper grades. In the last few years the quality of Japanese brushes has improved, and Japan has overcome to some extent the unfavorable impression that her product is cheap and inferior.

Although toothbrushes are used more extensively in the United States than elsewhere, the domestic production is small. There are not more than three or four factories in this country engaged in the manufacture of toothbrushes, and none of them make toothbrushes exclusively. They do not make a general line of toothbrushes, but produce only those of special device, or under patents, which retail from 35 to 50 cents each. In England and France bone handles are used; in Austria, Germany, and Japan pyroxylin plastics as well as bone are used; in the United States pyroxylin plastics are used almost exclusively. Statistics from Japanese official sources show that

Japan increased her exports of toothbrushes to the United States from 647,235 dozens, valued at $190,713, or 29 cents per dozen, in 1913, the last full year before the war began, to 1,421,863 dozens, valued at $444,736, or 31 cents per dozen, in 1916. The exports for the year 1913, however, were the smallest, both in quantity and value, in the 10-year period 1907–1916. In 1919 Japan exported to the United States 2,777,976 dozens, valued at $1,652,862.

A leading manufacturer made the following statement relative to the toothbrush industry:

I think the United States is more than half the world's market for toothbrushes. When I was in England in 1914 one of the leading advertising agencies told me that if we wanted to introduce the brushes into the Kingdom we would first have to educate the people to use the brushes; less than 10 per cent of the population used toothbrushes. In France it was less. In Germany it was considerably more. (From the statement of Mr. William Cordes, of the Florence Manufacturing Co.)

Next to toothbrushes, hairbrushes are imported in greater quantities than any other kind of toilet brushes. The competition between the domestic and foreign-made hairbrush differs from that in toothbrushes. The cheaper grades of the foreign toothbrush have little or no competition in the domestic market, whereas competition between the foreign and domestic hairbrush is keenest in the cheaper and medium grades. This is due in large measure to the difference between methods of manufacture employed here and abroad. The American hairbrush is mainly machine made; that is, the tufts are set by machinery, or the bristles are sifted through holes in a die and afterwards embedded in a composition. The use of machinery permits a greater output per employee than the hand-drawn method, which is followed in Europe and Japan. The hand-drawn method has, apparently, been attempted in the United States, but it is not in general use because the wages paid in America are higher than in Europe or Japan, where the work is done for the most part in homes by women and children.

The firm of Gerts Lombard & Co., of Chicago, one of our best known and highest grade firms attempted to make what is known as the hand-drawn solid back brush—we call it solid back because it is not split but made of one piece of wood—and they have gone out of that particular industry. It is practically impossible to make those brushes. (Statement of Mr. H. Alexander.)

We can make them, but it is not practicable to do so profitably. (Statement of Mr. William Cordes.)

Domestic manufacturers claim that foreign-made brushes are largely the product of home work, but that claim is denied by representatives of foreign manufacturers.

It is a known fact that the hairbrushes, toothbrushes, and all other toilet brushes imported into this country are largely the product of home labor, and are mostly the work of women and children. Whole villages in France, Hungary, Saxony, and elsewhere are given over to this industry without sanitary regulations of any kind and without restrictions as to the hours of labor. This condition is greatly intensified in Japan, which is sending in more hair, tooth, and nail brushes to the United States than any European country, and which has but four large brush factories that we know of. * * * Toothbrushes in Japan are almost distinctly products of child labor. Contractors and middle men will distribute handles and bristles to women and children at their houses and call there at least once a week to gather in the made-up brushes, paying a very small sum for doing the work. (Statement of Mr. H. Alexander, of the Henry L. Hughes Co., manufacturer.)

There is no home production in connection with our factory (E. Dupont & Co.) in France. I think our factory is pretty nearly as large and as complete as any factory of its kind in the world. The sanitary conditions there I do not think could be improved upon. There is absolutely no work done outside of our factory. * * *

Women and girls, from 16 to 17 years and older, but not children, are engaged in our factory. In fact, they are very strict about their schooling in France. (From the statement of Mr. F. E. O'Callaghan, importer.)

The only work that goes into the home (in France) is that of inserting the bristles into the brushes. The women are unable to leave their homes on account of domestic conditions, etc., and the consequence is the factory takes to them the material and when the work is completed collects it from them. So far as the shaping of the bones is concerned, polishing, washing the bristle and preparing it, all those articles are done in the factories, which are inspected regularly by the authorities to see that everything is perfectly clean and sanitary. (From the statement of Mr. Louis D'Angelo, of the Cauvigny Co., importers.)

Germany and Austria make use of automatic machinery in the production of hairbrushes. At present (1918) there is little competition in the high-grade brushes on account of the restricted importations from France and England. The French ivory hairbrush was much in vogue a few years ago and was instrumental in establishing the popularity of French-made brushes. Japan is now (1918) exporting greater quantities of airbrushes to the United States than ever before. In 1913 Japanese exports of hairbrushes to the United States amounted to 165,476 dozen valued at $292,007, ot $1.76 per dozen, and in 1916 to 261,063 dozen valued at $451,344, or $1.73 per dozen. Japan exported to the United States in 1919, 139,512 dozen of hairbrushes, valued at $347,604. While the quantity exported in 1917 and 1918 was greater than in 1919, the value was less.

The following statement regarding competitive conditions was made by a representative of Japanese manufacturers:

I think it can be said without contradiction that the importers have lost the business in hairbrushes which retail at anything from 50 cents down. We have not been able to get any goods that would compare in service with the goods produced in this country. * * * In the cheaper grade of brushes, on account of competition with the American makers, it is not possible to put in pure stiff bristles and they (Japanese) use the cheap, soft bristles. They must put something else in to give it sufficient stiffness.

You do not find mixed bristles on the American market used by the American makers, and in that lies the difference in value between the American cheap hairbrush and the Japanese cheap brush. In a cheap hairbrush the public wants a good stiff pure bristle, and they do not care anything about the back. It is on that account that we have not been able to increase our business on cheap hairbrushes in this country. Those competitive conditions are recognized in the trade, and for that reason the American cheap brush sells better than the imported cheap brush. (From the statement of Mr. W. B. Gibson, importer.)

What has been said in regard to hairbrushes is also true of nail, bath, cloth, and hat brushes. These brushes can be made by machinery, and it is on the strength of the greater output per employee, as well as factory organization and selling methods, that the domestic producer can compete with the foreign hand-drawn method. Shaving brushes are imported only in small quantities; the competition is among domestic producers.

Paint and varnish brushes.—There is little foreign competition in the heavy lines of paint and varnish brushes. They represent only a small proportion of the total brushes imported. Before the war, Germany was about the only country that exported this class of goods to the United States. Paint and varnish brushes are now (1918) being offered to the American trade by Japanese representatives, but their brushes are said to be cheap and poorly constructed. Japanese workers are not skilled in the art of making paintbrushes, and up to the present time American manufacturers have felt no competition.

The American paintbrush manufacturers have had all they could do right in their own country. We have not gone after the export trade to any great extent for the simple reason that our capacity has been limited owing to the scarcity of labor. We can not depend on any machine to produce our goods; we have to depend upon hand labor all the way through. * * * They (American manufacturers) tried to sell goods in South America, and they found the German product very strongly intrenched. * * * To-day a large percentage of the brushes used in those countres are either German, English, or French goods. * * * Heretofore there have been some few paintbrushes imported from Germany, and it is said that Japan is now trying to catch the American production. I have seen several samples, and they are very crude compared to ours. The German product is mostly a soft-hair brush. Some of the manufacturers make those lines but we do not. We do not meet any competition from abroad. (From the statement of Mr. George Barth, of the Bigelow Brush Co., manufacturers.)

Before the war we had made attempts to export goods, but the German competition was so severe, we never found it possible to do that profitably, and for that reason our line of exports has been very small. Another reason for the small amount of exports is the fact that the models of the German manufacturers were different from the American models, and we never discovered that there was enough profit in the German models to make it pay to copy them. (From the statement of Mr. J. H. Heroy, of Rennous, Kleinle & Co., manufacturers.)

The small imports of paintbrushes may be attributed partly to the difference in style between the American and foreign models, to the established reputation of the American brush, to the fact that the trades for various reasons prefer the American make, and to the nature of the brush itself, which is, perhaps, the chief reason. The materials used in the manufacture of the paintbrush enter largely into its value, and therefore the ad valorem duty is an effective protection.

Artists' brushes and hair pencils.—These brushes are made of soft hairs, and are used by artists, decorators, stripers, and letterers. The volume of production in the United States is small compared with the total production of all brushes. Some manufacturers of paint and varnish brushes handle artist's brushes as dealers, obtaining their stock from manufacturers who make a specialty of this line; others carry a line of imported artist's brushes. No machinery is used in the production of these brushes; they are made entirely by hand labor and much of the work is given out to be done in homes. Although the labor put in the American made article is less than in the foreign, the labor cost is relatively greater.

Some of this work is given out. The putting of the hair into the brush is often done outside, but the finishing of the goods, the extracting of the short hairs which are in every brush, etc., is all done in the factory.

There is a big field for that home work. We have in New York City, I will guarantee, 100,000 women who would like to do this work at home. I have picked up in a few weeks 100 extra hands in that way to make these cheap goods. I can not keep that up because the Japanese competition has spoiled my plans. These women would like to make the goods at home, because their housework only takes about half of their time, and a great many of them have absolutely no pin money whatever. If they can make $5 or $6 a week and only be employed half their time, they are very glad to do it. I think for my industry that is the greatest labor market in the world.

That work could not be done in New York State except through the granting of a license by the authorities. The authorities give licenses to any houses where the landlord allows the house to be investigated. The license is given to any house with three or four tenants; if it has less than three tenants no license is required. We have lots of houses licensed in Mulberry Street, right in the Italian district, where there will be anywhere from 12 to 20 families in a house. The landlords get a permit. (From the statement of Mr. A. Baker, manufacturer.)

Before the war 90 per cent of the importations came from Germany. Since German competition has been eliminated, this branch of the industry has had some prosperous years. The American manufac-

turer is not without foreign competition, however, as the Japanese have entered this field also. It is claimed that their brushes do not point up well and therefore are unsatisfactory. The Japanese have not as yet acquired the technical knowledge to become a serious competitor in the American market.

Before the war there was imported to the United States from Germany a very large quantity of soft hair brushes made of squirrel and similar hair. Few of this class of goods were made in the United States simply because they could be made much cheaper in Germany, owing to much lower labor costs. Since the imports from Germany ceased, some of the American manufacturers of soft hair goods have done a fairly profitable business, of course at a considerably higher price than before, as labor prices naturally were higher than those in Germany. Now you will find that Japanese manufacturers are offering these soft hair goods at prices below the actual cost price of the same goods made by American makers. (From the statement of Mr. William Cordes, of the Florence Manufacturing Co.)

In the last few months a good many of our styles have not been selling at all because Japanese competition has come in. Any large jobber can go to any Japanese importer, of which there are about 25 in this city, and that importer will send my sample to Japan, have it copied and they will produce it for less money than I can produce it myself. * * * I have no reason to believe that the goods are being shipped into this country at less than the cost of production abroad, because generally speaking, the Japanese price to-day is 20 per cent higher than the German price in normal times. I think it is legitimate, but I believe when times are normal the Japanese appetite will be so keen to keep this line of manufacture that she will undersell Germany. I do not think the German product was dumped on this country at an unreasonably low price, but the people in Germany seem to work so unreasonably cheap. (From the statement of Mr. A. Baker, manufacturer.)

American producers of household, shoe, horse, mill or machine brushes, and a great variety of special brushes, have little or no foreign competition. The small imports of these brushes are accounted for by the fact that some of the brushes can be made by machine, a method in which Americans excel, while others are of such peculiar shape and design that the demands of the trade can be more quickly supplied by the American manufacturer than by the importer, who is not apt to carry an extensive line of special brushes.

Imports.—The total value of the general imports of brushes of all kinds for the years 1910 to 1914, inclusive, averaged $2,062,114. In 1915 the imports fell to $1,644,189 and in 1916 to $1,292,801, but rose in 1917 to $2,209,976, the highest amount reached, with the exception of 1911 when the amount was $2,241,066. Since 1917 imports have increased in value, amounting to $3,170,143 in 1918, $2,756,910 in 1919 (calendar year) and $4,584,598 in 1920 (calendar year).

Previous to the war about two-thirds of the imports came from France, Germany, and England. The value of the imports from France and England has decreased more than one-half since 1914. The imports from Germany amounted to only $1,305 in 1917 as against $514,240 in 1914. The decline in imports from Austria-Hungary, although relatively large, has had little effect on the total value imported, as the imports from that country have never been in excess of $40,000.

The increase in the imports from Japan has more than offset the decline in imports from Europe. For the years 1910 to 1914, inclusive, the imports from Japan averaged about 30 per cent of the value of the total imports. In 1915 they amounted to $757,421; in 1916 to $843,020, and in 1917 to $1,800,300. During these three years they formed 46, 65, and 81 per cent, respectively, of the total

imports of brushes from all countries. For the calendar year 1919 imports from Japan amounted to $2,524,550, or 91.57 per cent of the total general imports.

Exports.—Comparatively few brushes are exported from the United States. In 1914 the total domestic exports amounted to $449,909, or less than 3 per cent of the total production for that year. Exports increased to $604,916 in 1915, and to $1,132,262 in 1916, but dropped in 1917 to $863,630. The increase in 1916 was due to the large purchases made for the British Government. The exports to England were: $27,213 in 1914, $301,865 in 1915, $621,104 in 1916, and $70,038 in 1917. The decline in the value of brushes exported to England in 1917 was due directly to restrictions placed on shipments by the British Government. Exports for the calendar year 1919 amounted to $1,470,555, and for 1920 to $2,085,821.

In 1915 and 1916 our export trade in brushes with England was greater than with any other country; with this exception Canada has been the chief country to which the United States has exported brushes. In prewar times Canada took between 40 and 50 per cent of our exports; since 1914 her share has varied from 13 to 29 per cent, the variation being due partly to a decrease, in some years, in value of the exports to Canada and partly to relatively larger increases to other countries.

Exports to other specified countries for the years 1914 and 1917, respectively, were as follows: Cuba, $31,717 and $81,252; Mexico, $17,640 and $56,849; Argentina, $10,561 and $39,994; Australia, $34,572 and $47,307; Brazil, $2,440 and $29,666. The increase in the export trade is traceable to the war. Those countries which depended upon Germany, England, and France have now turned to the United States for their supply of brushes. Domestic manufacturers have not, as a rule, sought an export trade either before or since the war began. They look upon the increase as temporary and believe that Germany, England, and France in order to regain their former trade, will sell brushes at prices so low that the American manufacturers will not be able to compete. Exports in 1919 to the specified countries above have continued to increase in value.

The kinds of brushes exported are not shown in official statistics but from other sources it is learned that our exports, especially those to Canada, are mainly paint and varnish brushes. Some of the large paint and varnish houses handle brushes as a side line in connection with their regular export and domestic trade. Toilet brushes are also exported, but they are usually brushes with established trademarks.

Duties collected.—The revenue derived from the importation of brushes averaged $625,000 for the fiscal years 1907 to 1909, inclusive; $804,000 for the years 1910 to 1913, inclusive; and $650,000 for the years 1914 to 1917, inclusive. The average for the last period was greatly affected by the war, which caused a large decrease in the value of the imports for the fiscal years 1915 and 1916, before the imports from Japan had offset the decrease from Europe. The first period was for the last three years under the Dingley tariff, the second period for four years under the Payne tariff, and the third period for four years under the Underwood tariff.

THE MANUFACTURE OF BRUSHES IN THE UNITED STATES.

The manufacture of brushes in New England began in the vicinity of Boston, and that locality has remained an important center of the industry in the United States. The historian of the town of Medfield, Mass., records: "In 1808 the manufacture of brushes commenced here and was a new industry in this section of the country." The brushes made in Medfield were an improvement over the English brushes and superseded them entirely during the War of 1812. The superiority of the American brushes was not, however, entirely responsible for the disappearance of the foreign product, as the war itself stopped all trade between the United States and England and gave American producers an opportunity to establish their goods in the American market. Brushes were also manufactured in Lansingburg, now part of Troy, N. Y., as early as 1810, and the industry continues to be an important one in that city.

SUMMARY OF THE INDUSTRY IN THE UNITED STATES.

The latest official statistics of the production of brushes are contained in the Census of Manufactures, 1914. In that year the industry was carried on in 359 establishments with capital amounting to $14,332,768. These establishments gave employment to 7,213 wage earners on the average during the year. The cost of materials was $9,326,655 and the value of the products $17,894,476. Massachusetts, with a product valued at $3,910,000, was first in production, but was closely followed by New York with $3,835,000. Other States with a product in excess of $1,000,000 were Maryland, New Jersey, Ohio, Illinois, and Pennsylvania.

Data for the industry as a whole and for the different branches, as defined by the Bureau of the Census, are shown in the following condensed table:

Items.	Total.	Toilet.	Paint and varnish.	All other.
Number of establishments	359	41	45	273
Wage earners (average number)	7,213	1,208	2,420	3,585
Capital (thousands)	$14,333	$2,329	$3,483	$5,521
Wages (thousands)	$3,461	$560	$1,262	$1,639
Cost of material (thousands)	$9,327	$1,109	$4,208	$4,010
Value of product (thousands)	$17,894	[1] $2,675	[2] $7,303	[3] $7,916
Value added by manufacture (thousands)	$8,567	$1,566	$3,095	$3,906

[1] Toilet brushes to the value of $545,501 were made by paint and varnish and other brush manufacturers, and to the value of $92,369 by manufacturers in other industries.

[2] Paint and varnish brushes to the value of $42,500 were reported by the "toilet" and "all other" groups, and to the value of $309,169 by establishments assigned to other classifications, principally "paints."

[3] "All other" brushes to the value of $260,884 were made by toilet and paint brush manufacturers, and to the value of $685,399 by establishments in other classifications, principally "upholstering materials, not elsewhere specified," and brooms.

DISTURBANCES DUE TO THE WAR.

The domestic production of brushes has been greatly stimulated by the partial elimination of European competition, increased purchases by the United States Government for the use of the Army and Navy, larger orders from foreign countries whose trade was

formerly supplied by Europe, and increased activities in other industries.

In the first year of the war the British Government and the French Government had commissioners in this country trying to buy brushes from the manufacturers to help them in equipping their armies. That condition might account for some increase in 1916. Since then they have taken care of the situation themselves and are supplying their market. * * *

The war has had the effect of increasing our production. I think, in our particular case, it is due to the fact that there are no goods coming from foreign countries. We do not expect to hold the business we are doing now after the war is over, by any means. (From the statement of Mr. William Cordes, of the Florence Manufacturing Co.)

The demand in this country has been very heavy because of our entry into the war. We have had very large requisitions from the Navy and the Army in all the different departments, so that we have had difficulty in getting enough material to supply the needs of our own Government. (From the statement of Mr. J. H. Heroy, of Rennous, Kleinle & Co.)

The value of the general imports of brushes from European countries fell from about $1,500,000 in 1914 to about $400,000 in 1917, a decrease of approximately 70 per cent. Domestic exports were valued at $863,630 in 1917, as compared with $449,909 in 1914, an increase of 91.9 per cent. Brush machinery that was idle prior to the war is now (May, 1918) in operation, and manufacturers are installing new equipment and increasing the number of employees, as far as possible, to meet the demands of the domestic and foreign trade. The decrease in imports from Europe was more than offset by the increase in imports from Japan—an advance from $665,952 in 1914 to $1,800,300 in 1917, or an increase of 170 per cent.

The most serious disturbance in the brush industry, created by the war, is the shortage of bristles. Conditions in Russia and the uncertainty of shipments have caused a scarcity of Russian bristles and an advance in price since 1914 of 100 to 300 per cent. Some grades can not be obtained at any price; French and German bleached bristles are no longer on the market. The Chinese supply has been heavily drawn upon because of the scarcity of the Russian stock. Manufacturers are also resorting to bristles from India, commonly called Calcuttas. These have also advanced in price, but not to the same extent as the Russian bristles.

The war has made it very difficult to obtain bristles. There are two reasons for that. One is the fact that a great deal of our bristles came from Russia, and the system of transportation from Russia had been very much interfered with; Russia's commercial life has been altogether interrupted, and at the present time we know of no bristle coming out of Russia. The only bristle to be had is the bristle that has already come out of the country. The other source of supply is China, and that supply has been drawn on very heavily because of the scarcity of the Russian stock. The difficulty in the case of the Chinese bristle is the difficulty in getting bottoms in which to bring the material over. (From the statement of Mr. J. H. Heroy, of Rennous, Kleinle & Co., manufacturers.)

Russian bristle is very scarce at this time, and of course the price is very much increased. Bristle is bought according to length, and the price is fixed on each length according to the demand. On some black goods to-day you can buy 3¾-inch bristle, for instance, just 5 cents a pound cheaper than you can buy the 4-inch. That is, perhaps, on account of the scarcity of 4-inch. It depends on how stocks are in this country. Since the beginning of the war prices have advanced on the Chinese goods 75 per cent, I should say offhand. On the Russian goods they have more than doubled; they have trebled in some cases. (From the statement of Mr. G. Barth, of the Bigelow Brush Co., manufacturers.)

Celluloid has advanced in price on the average 85 per cent, horsehair 50 per cent, brass wire 140 per cent, iron wire 50 per cent, and other materials in varying proportions since 1914. At times manu-

facturers have had difficulty in obtaining materials on account of freight conditions and the inability of producers of brush materials to supply the demands of the trade.

Wages have increased on the average 25 per cent since 1914. Although there has been no general increase in wages by collective bargaining on the part of employees, manufacturers have increased the wages of individuals and of groups of wage earners, in order to retain their present force as well as to induce labor to seek employment in their factories. The scarcity of labor is attributed to the draft and to the high wages paid by manufacturers engaged in the production of war supplies. Under this handicap, manufacturers have not been able to increase their output to the extent that the present demand for brushes would justify.

RAW MATERIALS AND THEIR ORIGIN.

Bristles.—Bristles obtained from the hog are the principal raw material used in brush manufacture. A feature of the bristle which especially adapts it to the manufacture of paint brushes is the "flag" or split end. This tiny split or division into several parts of the outer end makes it a perfect paint and varnish smoother and distributor. The flag end has no value to makers of toilet brushes. Another peculiar feature of bristles is the "bend" or natural curve, which must be taken into consideration in making paint, varnish, and other brushes of like character. The best grades of bristles, determined by length, color, stiffness, shape, texture, and resiliency, are obtained from hogs living in cold climates; hence Russian and Siberian bristles are known for their superior quality. Russia and China supply most of the bristles used in the brush industry. Russia is first in production, followed in the order named by China, Germany, and India. France produces a limited quantity of fine white bristles. The French have the best process of bleaching bristles; "French bleached" stands for the highest grade of whiteness. Other countries of central Europe produce and export considerable quantities of bristles. Those produced in the United States are a by-product of the slaughterhouses. They are short and inferior in quality on account of the breeding of the hog and its immaturity when slaughtered. American bristles are used principally in the manufacture of the cheaper grades of brushes, such as shoe and dust brushes.

The introduction of Chinese bristles into the American market was an important event in the brush industry. The objections of the trade to the substitution of Chinese for Russian bristles were largely overcome by the discovery of the proper treatment of the Chinese bristle. The chief obstacle to the use of the last named was the fact that its peculiar characteristics necessitated a method of treatment different from that used in preparing the Russian bristle. Chinese bristles are generally black and range in length from 2½ to 7 inches. They are as resilient as the Russian but are not so tough or so durable. Their hard-polished surfaces are undesirable in brushes.

Bristle markets.—The chief center of Russian bristles before the war was Leipzig, Germany. The German bristle houses sent their agents throughout Russia and Siberia, chiefly to Nizhni Novgorod, where fairs were held and to which place came the caravans carrying,

among other articles to be sold, the bristles procured from the Russian farmers. The raw bristles were dispatched in bulk to Leipzig, where they were sorted, roughly cleaned, bundled, and prepared for further distribution. The chief centers of distribution of Chinese bristles are Tientsin, Shanghai, Hongkong, and Hankow. Before the revolution in Russia bristle dealers were endeavoring to divert the course of trade from Leipzig to some center in Russia, so that after the war Russian firms might secure the profits which would otherwise go to German middlemen. London at present (1918) controls the bristle trade. The Japanese are endeavoring to secure control of the Russian bristle market, and are said to have copied the effective German system of the past. The main source of supply of Siberian bristles is in the district bordered by the Urals on the west and the river Lena on the east. The question now arises as to whether, should the Japanese extend their sphere of influence westward, the market in the future would not be centered in Kobe. The control of the Chinese bristle trade is also being sought by the Japanese, but has thus far been prevented by the strength of British merchants in China.

Japan is getting a pretty strong hold on the bristle market and is endeavoring to control it. We have bought bristles within the last year from Japan, through a Japanese representative, which we never thought of doing heretofore. It is the first time in the history of our business, extending over a period of 50 years, that we have bought bristles direct through Japanese representatives. (From the statement of Mr. William Cordes, of the Florence Manufacturing Co.)

Substitutes for bristles.—No satisfactory substitute for bristles has yet been found. In the cheaper paintbrushes, horsehair and a fiber known as tampico are mixed with bristles, but they merely serve to increase the size of the brush at the expense of its quality. Their presence in some brushes is not easily detected except by those familiar with the industry. In hairbrushes and in some other toilet brushes split quills are also used to cheapen the quality.

Hairs.—Some brushes are made entirely of hair. Horsehair is flabby, lacks the toughness, strength, spring, and wearing quality of bristles, and, what is very important to paintbrush manufacturers, the absorbing or paint-holding power of bristles. Horsehair is imported from England, Argentina, Italy, Russia, Brazil, Germany, and Uruguay. The domestic supply is from Texas. Red sable hair, a product of Siberia, is the most valuable hair put into brushes. It possesses fineness, toughness, elasticity, soft ends, and great durability. Brushes made of red sable hair are used by artists in miniature painting and in other fine work. Black sable hair serves for brushes used by sign writers and decorators, for lettering, striping, and scrollwork. Squirrel hair, designated camel hair, is fine and has soft ends; it is used largely in the manufacture of brushes for water-color painting. The real camel's hair is a Manchurian product. Skunk hair, dignified by the name of fitch hair, is used in large quantities for varnish brushes. It possesses elasticity and toughness, but lacks softness in the ends. Ox hair and bear hair are also largely used in making varnish brushes. Badger hair, which is long, tough, and coarse, is frequently used for shaving brushes. Hair of other animals is also used in brush manufacture.

Vegetable fibers.—Vegetable fibers, obtained from palms growing in tropical countries, are largely superseding bristles in the manufacture hai[illegible] the coarser kinds of brushes. Tampico, the principal fiber used othe[illegible]

in brush making, is imported from Mexico and to some extent from South America. It is very coarse and is much cheaper than bristles or horsehair, but it does not possess the wearing qualities of either hair or bristles. It is entirely too coarse for paintbrushes, but is adapted to cheap floor sweeps, counter dusters, and other brushes for cleaning purposes.

Tampico is not easily distinguished from bristle and some bristle dressers have not hesitated to insert a first-class quality of the fiber in their packages of bristle. (From the statement of Mr. W. C. Howard, manufacturer.)

Bone.—Bone, used for backs or handles of toothbrushes, is one of the by-products of the large meat-packing houses in North and South America. The better grade toothbrushes are made from selected thigh bones of cattle. Buttock and shin bones are used for the cheaper grades. Bone handles, shaped, polished, drilled, and ready to have the bristles inserted are being offered in the American market by Japanese manufacturers at a price less than cost to American producers, notwithstanding the fact that the bone is shipped from Chicago to Japan and thence back to the United States, the Japanese paying the same price, f. o. b. Chicago. It is represented that a large proportion of the toothbrushes used in the United States have solid back, bone handles. These brushes are largely imported from France and Japan. The bone brushes produced in the United States are wire drawn, with channels on the back filled with wax. Machinery has not been employed effectively in the United States in the manufacture of toothbrushes with bone handles.

Under normal conditions we have been able to buy the handle of the brush we make—when we made it of bone—in Japan at 27 per cent less than we could make it in our own factory, and the raw material, the bone from which the handle of the brush was produced, was shipped from this country to Japan. It is entirely a question of labor, because they can not buy bone any cheaper than we can buy it. * * * We are making toothbrushes by machinery, and we can do it as long as we can use pyroxylin. We can not make them by machinery with bone. The Germans claim that they have been successful in making them with bone, and we have a sample of a bone brush made on a machine. (From the statement of Mr. W. Cordes, of the Florence Manufacturing Co.)

Pyroxylin plastics.—These plastics are variously known by the trade names of celluloid, pyralin, fiberloid, and viscoloid. They consist of pyroxylin—a variety of nitrocellulose—and camphor, with or without a pigment, which is usually zinc oxide. The addition of the pigment gives the opaque product; and desired color may be produced by the addition of suitable dyes. The resemblance of some of these plastics to ivory, in texture and color, has made them very popular materials for the backs of toilet brushes, especially those in sets. Toothbrush handles of plastics are rapidly replacing those made of bone. They are not so porous as bone and for that reason are more sanitary; they will not split and lacerate the gums; they can be used more successfully than bone in making brushes by machinery, as bone splits in the process of drilling; also the metal staple or anchor used to fasten the tuft in the handle or back can be more firmly embedded when plastics are used. Possible rival commodities of the pyroxylin plastics are those of the synthetic phenolic resin type, variously known by the trade names of bakelite, condensite, and redmanol.

Wood.—Wood used in the backs or handles is generally of the hardwood variety imported from tropical countries. Birch, beech, maple, and cherry from New York and the New England States, and

redwood from California are also used. Some manufacturers buy the wooden handles or backs ready-made; others cut them from the log or lumber in their own factories.

Adhesives.—In the manufacture of simple brushes and in some compound brushes, adhesives are used to secure the bristles. Brushes are set in a composition of shellac, pitch, and other gums, in cement, and in glue, the adhesive depending upon the ordinary use for which the brush is intended. A departure from these setting mediums was the use of vulcanized rubber. Hard rubber is insoluble in almost anything in which bristles can be used, whereas other adhesives are more or less susceptible to the action of various liquids.

Miscellaneous materials.—The materials used for binding the bristles to the back or handle are twine, wire, leather, and ferrules of iron, steel, tin, and brass. Other materials which become part of the finished brush are tacks, screws, nails, paint, and varnish.

METHODS AND PROCESSES OF MANUFACTURE.

In the United States brush making started as a household or neighborhood industry. The custom of putting out work to be done in the homes of employees is decreasing, and is confined principally to the drawing of bristles into the backs or handles by hand. The State laws of New York require that tenement houses in which goods are made shall be licensed, and that goods made in homes shall be so marked. Laws regulating the hours of labor, employment of minors, sanitation, and minimum wages have improved the working conditions of the industry. Power machines and other labor-saving devices are now replacing hand labor. This evolution has been slower in the brush-making industry than in most others, notably the textile. There are, however, operations which do not readily lend themselves to the use of automatic machinery. The use of automatic machinery is confined to bristle combing and mixing, to nailing in the manufacture of simple brushes, and to boring and tuft setting by means of staples or anchors in the manufacture of compound brushes.

In the production and manufacture of paintbrushes skilled labor is absolutely required. We have no machines to put the brushes together. The only machines used in our manufacture are what we call the bristle mixing machines and the nailing machine. Aside from those things everything else is done by hand. Some people may be under the impression that it does not require any skill to make a paintbrush. We would not attempt to put a man on certain brushes unless he had had at least three or four years' experience at the bench, for the reason that if the bristles was not turned in, in what we call the flag ends were not turned in, in the proper shape, so that when it is put into the material it will work and wear like a chisel, instead of spreading out like a painter's duster, the brush would not be any good. (From the statement of Mr. C. Barr, of the Bigelow Brush Co., manufacturers.

The article is entirely too delicate for machine production. One of these little tufts of hair is so delicate that the average person would not know that they had it in their fingers. He could not control it and could not work it into shape. To learn how to make brushes properly a person should start in his youth. The hair is produced from the tails of various animals—squirrels, marten, mink, etc. It is only after a person has got used to feeling the hair with the fingers, knowing how much he has and how much it varies in length, etc., that he can make a good brush. (From the statement of Mr. A. Baker, manufacturer.)

Brushes are simple when they have a single tuft of bristles or hair, as paint, varnish, and shaving brushes, and compound when they have a multiplicity of bristles or fiber tufts, as hair, tooth, nail, hat, cloth, shoe, and scrub brushes.

Brushes may also be divided according to their use into three classes: (1) Brushes for toilet purposes, as hair, tooth, nail, bath, and shaving; (2) brushes for painters and artists; (3) brushes for cleaning and polishing, as shoe, scrub, stove, and the great variety of special brushes which come under this class.

SIMPLE BRUSHES—PAINT AND VARNISH.

Preparation of bristles.—Although bristles are generally bought graded as to length and roughly cleaned, they are put through a number of processes before they can be used in brushes. They are further graded as to length by a process called dragging, are washed, dried in a kiln, wrapped around wooden plugs to straighten the bend, and in case of light stock are bleached. These operations are performed by hand. The bristles are then combed and mixed for stock, generally by machinery; the mixture depends upon the grade and kind of brush to be made. The tangles are removed by combing, and all the flag ends are placed one way. The cost of production is reduced by mixing bristles of different quality and varied lengths. The mixing of different lengths is a real advantage, because it permits new flag ends to be brought into use as the longer bristles wear out, and because it prevents the brush from wearing stubby.

Brush making.—This operation may be said to be first in the manufacture of paint and varnish brushes. The stock that goes into each brush is weighed by the brush maker on a hand scale. The required amount of stock is then taken up to be made into a brush. It is here that the skill of the brush maker comes into play. Notwithstanding previous treatment of bristles to remove the bend, they still retain this feature. The brush maker, by a few movements of the hands, so arranges the bristles that the natural bend is inward, toward the center of the brush. If the bend is not properly arranged, the bristles will spread and the brush will prove unsatisfactory to the user.

Metal-bound flat brushes.—The brush maker, after arranging the bristles, inserts them in a metal band, which protrudes some distance above the butt ends of the bristles. If the brush is not made solid, wooden plugs or strips are inserted as a filler and to secure the bristles more firmly in the metal band.

Metal-bound round and oval brushes.—The brush maker, in addition to arranging the bristles and inserting them in a ferrule, pushes the handle backward through the center of the tuft, small end first, and then drives it into place by the hard blows of a hammer.

Chisel-pointed brushes.—The flag end of the tuft is put into a cup, wedge-shaped at the bottom, as large as the brush to be made. By tapping and gentle pressure the tuft settles down into the cup, from which it is removed in the desired shape, and is placed in the binder.

Leather-bound brushes.—The bristles are distributed around the handle or block. The brush maker, by his sense of touch, always keeps the bend of the bristle inward and toward the center. In place of a metal ferrule as a binder, a strap of leather is drawn tightly around and nailed to the handle by hand.

Brushes set in vulcanized rubber.—The operations are somewhat different. The tufts are partly secured by the application of unvulcanized rubber before being placed in the bands or ferrules. Owing to the hardness of rubber after vulcanization, it is necessary to drill holes in that portion of the brush in the band or ferrule before the brush can be nailed.

Applying adhesives.—The adhesive, if cement, is poured into the open end of the metal band over the butt end of the bristles, or it is driven in by a machine operated by compressed air; if vulcanized rubber, the unvulcanized gum is applied to the butt end of the tuft. which is then placed in a kiln to evaporate the benzine or other solvent. After the tuft has been placed in a band or ferrule the brush is ready for vulcanization, the time for which varies according to the character of the work.

Other operations.—Handles are inserted in the ferrules or bands, are nailed into place either by hand or by a power-driven machine, and the loose bristles are eliminated and the brushes trimmed. The brushes are then moistened, wrapped in paper, and placed in a kiln, in order to give the correct position to the bristle. Names or brands are stamped on the handles, which are then varnished or painted by hand, or the brushes are placed in racks and the handles then dipped in varnish or shellac. When dry the brushes are inspected, the bristle end is papered to maintain the shape, and the brushes are placed in boxes for shipment.

COMPOUND BRUSHES.

Hair, tooth, cloth, hat, shoe, and other brushes containing a multiplicity of tufts are subject to similar methods of manufacture.

Preparation of bristles.—Bristles are received in bunches, ranging in diameter from 2 to 12 inches. Before they can be used in the manufacture of brushes, they must be inspected, washed, sterilized, bleached, combed, dragged, cut into proper lengths, mixed, bunched, and weighed.

Preparation of backs or handles.—When wood is used, it is cut into slabs of approximately the length, width, and depth of the brush backs. The slabs are then roughly shaped and planed before being sent to the shaper, who by the use of rapidly revolving knives gives them their final form. The sand wheeler removes the rough edges and smooths the backs, which are then sent to the finishing room, where they are subjected to various processes to give them the desired finish. Holes are drilled in the backs or handles, except in the so-called rubber-cushion and composition-face brushes, the backs of which are routed—that is, hollowed out. If bone is used for the backs and handles, the operations vary according to the grade and quality of the brush to be made. The usual operations are the sawing of the thigh bones into slabs, which are in turn milled to the thickness desired, shaped, drilled, bleached, polished, weighed or counted, and inspected. In pyroxylin plastics are used, the blanks are put though various processes of shaping, drilling, polishing, and inspecting, the number of operations varying in different establishments as well as in the grade of the brush to be made.

Hand-drawn, veneered, or two-piece brushes.—The oldest known method is that employed in making a veneered or two-piece hand-

drawn brush. It is distinctly handwork. The wooden block already shaped into a brush back, flat on top and containing the required number of holes, is sent to the drawer, who passes a loop of fine wire or thread through one of the holes from the back of the block and inserts the proper amount of bristles in the loop. By drawing the wire or thread tight, the tuft is bent double and pulled into the hole. The process is repeated until all the holes in the block are filled. Backs are then fastened to the blocks containing the rows of tufts, either with glue or screws and sometimes both. This method of making a brush is employed more extensively in Japan and in the countries of Europe where labor is cheap, than in the United States. Wherever brushes are made by the hand method the drawing is done to a very great extent in the homes of the employees by women and children.

Machine-drawn brushes.—This process is more manual than mechanical. The machine measures correctly the quantity of bristles and marks their center, thereby facilitating the manipulation of the wire. The operator proceeds in much the same way as in hand drawing, the principal difference being that the bristles are measured and centered by machine instead of by hand. The use of the machine insures smaller wastage.

Handmade, trepanned, solid-back brushes.—The solid-back brush, as its name indicates, consists of one piece only. Vertical holes are bored halfway through the brush block, where they intercept longitudinal channels extending from end to end. A block so prepared is said to be trepanned. Threads are inserted into the channels and drawn up through the vertical holes to the surface by means of a fine hook. The tuft is then placed in the loop and when the thread is drawn taut, the tuft is forced into the hole. The process is repeated until every hole is filled. The ends of the longitudinal channels are plugged to secure the threads. The drawing, like that of the two-piece brush, is done almost exclusively in the homes of employees. This process is much in vogue in France and in Japan and to a less extent in England, Germany, and Austria in the manufacture of hair, tooth, nail, and cloth brushes. Manufacturers in the United States do not follow this method extensively, as labor conditions are against it. Brushes are sometimes made to have the appearance of being trepanned by the insertion of plugs in holes at the end of the brush.

Staple or anchor fastened, solid-back brushes.—Brushes made by this process are more properly designated solid-back brushes than the trepanned brushes, because there are no longitudinal channels but only the holes in which the tufts are secured. An automatic machine has been perfected which measures the bristles, bores the holes, inserts the tuft in the hole and secures it there by means of a wire staple or small steel anchor. This method is used extensively in the United States in the manufacture of hair, tooth, and other toilet brushes. The use of automatic machinery, however, is not confined to the industry in the United States; in fact the automatic tooth-brush machine was invented in Austria, and the automatic machine for making hair brushes is the product of French or Belgian ingenuity. Germany and Austria have manufactured machine-made brushes for many years. Some of the choicest tooth brushes with celluloid handles which come from Austria are machine made. Brush makers in Japan are keenly alive to the exigencies of the situation and are

installing or making preparations to install automatic machinery, either imported or copied. It is claimed that the Japanese brush makers, having the advantage of cheap labor, will be able to place brushes on the market at a price below the range of possibility to American manufacturers. However, those who are familiar with conditions in Japan state that the Japanese worker does not readily adapt himself to factory regulations, and for this reason his output per machine is not equal to that of workers in other countries.

The Japanese workman is not frivolous, but he is not yet trained to our ideals of factory workmen; that is to say, to working steady hours, to working constantly, and being willing to perform the same operation time after time throughout the day. The Japanese workman prefers a little variety in his work, and that is why he excels in carving, in painting, and in things of that kind, where he can put a little originality into the production. His natural traits are so strongly opposed to methodical work that it is impossible to put him on machines and get any kind of results. We have tried machine drawing and it does not pay. The amount of bad workmanship is more than enough to make up for the increase in speed. For that reason we continue the hand drawing and will probably do so until the nation develops characteristics which will make them good, efficient work people. This condition has always jeopardized their industrial future and always will. (From the statement of Mr. W. B. Gibson, importer.)

The use of machinery has shut out labor to some extent. When those brushes (toothbrushes) were drawn by hand a good many of them were made in the homes of people and drawn by them, and that has been eliminated entirely.

About 10 years ago we bought the United States rights to the Gruneberg (Austria) machine, which we still hold. The machine we are now using is not the Gruneberg machine. It is our own. There has been an absolute change in the machine, embodying not only the Gruneberg patents but also the McClintock-Young patents. I do not know if these automatic machines are used in Japan. Mr. Gruneberg is operating his machine in his own factory in Austria, and his brushes are shipped to this country to some extent. One brush, known as the Kleanwell, is a Gruneberg product. That is the celluloid end of it, and the others are bought in France, or wherever the importer can get them. I do not think that there is a greater use of automatic machinery here than abroad, except in our particular line. I think there are very few machines used in the making of other brushes. (From the statement of Mr. William Cordes, of the Florence Manufacturing Co.)

Composition face brushes.—The composition face brush is the result of modern tendencies to produce on a large scale and at low costs. It is an original American process. The brush block is routed—that is, the under side is hollowed out and filled with a plastic composition. Bristles are shaken or sifted by means of an agitator through the holes of a die or pattern. The tufts are forced into the composition which, when hard, firmly holds them in their proper places.

Rubber-cushion brushes.—In rubber-cushion brushes the blocks are routed and undercut. The bristles are sifted by an agitator through the holes of a piece of rubber somewhat larger than the recess of the block. The ends of the bristles protruding through the rubber are ironed down, and liquid rubber is placed over the ironed ends and vulcanized. The rubber containing the tufts is inserted in the back of the brush. A hole is bored in the end of the brush to allow the passage of air under the rubber to give the cushion effect. Hair-brushes are made by this process both in the United States and in England.

Cement-set brushes.—By this method the tufts are secured in the backs of brushes by placing the proper amount of cement in the holes and afterwards inserting the tufts by hand. The method is simple, yet its successful application may be said to be confined, in the United States, to one establishment. On account of the greater

labor cost involved, brushes made by this process are generally the high-priced articles.

Pitch-set brushes.—In this method, sometimes called panwork because the workers sit around a pan of melted pitch, one end of each tuft is dipped in melted pitch and bound with thread. The tufts are then redipped and inserted with a twisting motion into the holes of the handle or back. Counter dusters, floor sweeps, and blacking brushes are among those made by this method.

The foregoing are methods used in the manufacture of multiple tuft brushes. No attempt has been made to describe each single operation in the manufacture of a brush; only general methods have been dealt with. The number of operations is determined not only by the grade of the brush but by the policy of the company in regard to the division of labor. As an illustration of the number of operations in making a toothbrush, one manufacturer reports that there are about 40 operations in making a toothbrush with a bone handle and about 30 for one with a celluloid handle. These operations include the forming and finishing of the handles, inserting the tufts, serrating and shaping of tufts, stamping or printing of names and trade-marks on the handles, inspecting the work at various stages, counting or weighing brushes, grading, sterilizing, and boxing and assembling for shipment; in fact, all operations except the preparation of the bristles.

Production in Foreign Countries.

Brush making in the various countries of Europe is relatively a small industry, and only meager descriptions of industrial conditions are to be found. Apparently the American consuls have not been called upon to make special reports on this industry, as an examination of their reports discloses very little information in regard to the manufacture of brushes. Statistics of production are not published by European nations as a rule; England had its first census of production in 1907.

FRANCE.

The French product consists largely of hair and tooth brushes, and is noted for its graceful and artistic design as well as for its fine quality. The bristles used in the manufacture of brushes are imported from Russia and Rumania. Before the war France also secured bristles from Leipzig. France, however, produces a very fine quality of white bristles. The French possess a superior method of bleaching, and the bristles so treated are much in demand for the manufacture of the better grades of brushes.

In the manufacture of toilet brushes, France follows principally the hand-drawn trepanned method. Much of the drawing is done in homes by women, when not occupied with their household duties, and by children after school hours. Whole villages are engaged in the production of brushes. The contractor delivers the materials to the workers at their homes and afterwards calls for the finished product. In a review of the trade and industrial conditions for the year 1915, Consul General A. M. Thackara, Paris, says:

> The French manufacturer has realized that too much of the work in the manufacture of brushes has been done by hand. Already steps are being taken to change the methods of production by the introduction of machinery after the war.

GERMANY.

Development of the industry.—In the early days of the industry the brushes were coarse and not much skill was required in their manufacture. Home workers, whose products exceeded their domestic requirements, went over the country selling their wares. In the larger cities, however, brush makers maintained fixed places of business, but they were often compelled to visit adjacent markets to dispose of their product.

Brush making as a home industry developed in two centers. One at Schonheide and the other at Todtnau, in the Black Forest region of Baden. According to some authorities, this industry did not start until the beginning of the nineteenth century, but there is evidence from certain decrees that it was in existence as early as 1623.

Capitalism brought about many changes in the industry. The first large factory was erected in 1862 and others soon followed. The large manufacturers began to gain control over the home workers, who were virtually forced into selling their products to their large competitors.

From Todtnau the industry spread into numerous other places; in 1895 there were 440 establishments with 2,143 workers in the Grand Duchy of Baden. In 1907 the number of establishments had decreased to 276, but the number of workers had slightly increased. The decrease in the number of establishments was due to the absorption of the small independent producers by the large establishments. Home work was limited more and more to women and children.

Brush making was also carried on at an early date in the Hartz Mountains of Saxony. It was a home industry closely connected with peddling. It may be assumed that the industry was in existence as early as 1580, from which date brush makers were regular visitors to the Leipzig fairs. In 1854 there were a few establishments that employed outside help.

Concerning the later development of the industry in Germany, some information can be gained from the statistics of occupation and industry. The number of establishments increased from 6,098 in 1882 to 6,191 in 1885, and the number of employees from 15,378 to 22,970. The centralization of the industry is shown by a comparison of the number of establishments in 1895 with the number in 1882. Small factories decreased from 5,804 to 5,666, while medium size factories increased from 270 to 462 and large factories from 24 to 63. A similar comparison of the statistics for the years 1895 and 1907 shows an increase in the number of large factories and a decrease in the small factories. No later official data are available which show the development of the industry in Germany.

Use of machinery.—Some of the machines in use are boring, cutting, grinding, polishing, shaping, planing, stamping, mixing, combing, and washing machines. German manufacturers have also made use of the automatic boring and tuft setting machine. In fact, some advertise that the tufts are fastened with steel anchors, and others claim that they have successfully made toothbrushes with bone handles by machine.

An importer, formerly representing a German firm, gave the following description of labor conditions:

There is no child labor employed at all in our factory. We guarantee our goods to be union made goods, even the quill brushes. I think the proportion of woman labor employed is about 60 per cent. The women work in a separate part of the factory and do a different kind of work. The period of apprenticeship is moved up from year to year until they make the very finest artists' brushes. You see the brush industry is divided into a good many industries, a good many kinds of brushes. A factory may make paintbrushes, shaving brushes, and artists' brushes, and while they are all classified as brushes, each department of the factory is a separate department.

The socialist union over there controls the conditions of apprenticeship. The factory requires the learner to be of age so that he is able to work. The union will not allow men who are not of age to work in the factory. (From the statement of Mr. Walter Grumbacher, importer.)

ENGLAND.

Centers of the industry.—London is the chief center of the brush industry. According to the returns made in the First Census of Production, 1907, there were 44 factories and 55 workshops engaged in the manufacture of brushes in London. Birmingham is also an important center, but the manufacture of brushes is mainly carried on by small firms which, as a rule, buy the bristles, vegetable fibers, and wooden handles or backs ready for use.

Materials.—England, like most of the other brush producing countries, imports many of her raw materials. Bristles, in normal times, were imported from European countries, China, and India. The fact that London is an important bristle market gives the British brush manufacturers an advantage. Bone, used in making toothbrush handles, is imported from Australia, South America, and North America. Fibers are imported from various tropical countries, and wood for brush backs from Scandinavia and from tropical countries. Although England imports many of the raw materials used in brush making, she is not entirely dependent upon foreign countries, as many of the materials can be obtained from her colonies. The strength of British merchants in China assures England of her share of the trade in Chinese bristles.

Methods of manufacture.—Brush making is largely handwork and to a considerable extent is a home industry. Some firms specialize in one branch of the industry; others make all classes except artists' brushes—a branch of the industry carried on by only a few small firms in London. Machinery is being increasingly used, although in Birmingham labor-saving machinery has not replaced handwork even in those shops where it has been installed. That the British brush manufacturers intend to make greater use of machinery is apparent from a report of the convention of the British Brush Manufacturers' Association, recently held in Birmingham.[10] One of the topics discussed at the convention, in connection with reconstruction after the war, was the unemployment resulting from the introduction of new machinery. An interesting feature of the convention was the exhibition of the latest types of filling and boring machines. An operator on one of the filling machines was able to insert 130 knots per minute, and although it was not expected that such a rate of speed could be maintained, it was claimed for the machine that its output would equal that of 10 ordinary drawing hands.

[10] Brooms, Brushes, and Handles, May, 1918.

The goods produced in the early stages of the industry were cheap and inferior in quality and could not compete with the better grades of brushes made in the United States and Europe, where the industry has been established for many years. The Japanese therefore devoted their energies to improving their methods of manufacture and the quality of their brushes. They have met with such success that Japan is to-day (1918) one of the leading countries in the production of toilet brushes, the branch of the industry to which until recently she has confined her efforts. Since the outbreak of the war she has enlarged the scope of her brush manufacture and is now offering in the American market artists' brushes and some of the smaller paint and varnish brushes. The industry is carried on in all parts of Japan but centers in and around Osaka, where over 80 per cent of the brushes are produced.

Materials.—The raw materials used in brush making are nearly all imported. Bristles are obtained from China and Russia; bone from the United States, Australia, China, and South America; wood for hairbrushes is imported in the log, although some Japanese oak and maple are used; thread is from Scotland; chemicals used in bleaching, with the exception of sulphur, are from foreign sources, as are also materials for polishing and finishing and the paper and pasteboard used for boxes. Japan's advantages in regard to materials are her nearness to the Chinese bristle markets and her control of the supply of camphor, an essential ingredient of the pyroxylin plastics used for backs or handles.

Celluloid is an American product. It was discovered here; it has been made a commercial success here by American capital and American brains. Pyroxylin plastic material has been made in Germany, Austria, France, England, and Japan. Perhaps the most dangerous competition to the industry that exists is with Japan, largely because that country controls the world's camphor supply. There used to be three producing points for camphor, one Japan proper, one Formosa, and one China. Chinese camphor was always inferior and in recent years it has not been produced at all. (From the statement of Mr. D. G. Maynard, of the Celluloid Co.)

It is true that Japan produces most of the natural camphor, but Germany made celluloid, I think, from synthetic camphor and produced celluloid which was equal in quality and price to that produced anywhere in the world. (From the statement of Mr. W. B. Gibson, importer.)

Methods of manufacture.—The preparation of the bristles and the shaping, drilling, and polishing of handles and backs are done in the factory. Drawing, one of the principal operations in the manufacture of toilet brushes, is given out to be done in the country; especially is this true of the larger factories. In the manufacture of toilet brushes, the chief difference between the methods employed in Japan and in the United States is the manner in which the tufts of bristles are secured in the back or handle. In Japan the tufts are drawn into the block by hand, whereas in the United States they are generally inserted by automatic machinery and secured by means of staples or anchors.

The use of machinery has not proved profitable in Japan. The only factory now (spring of 1918) using machines is being reorganized. Generally speaking, all operations are performed in the factories. Approximately 90 per cent of the wage earners are employed in factories. Sanitary arrangements are crude, but the interiors are kept clean, especially in the drawing factories, which are generally in rural districts. (From the statement of Mr. P. B. T. Williams, of Williams Brush Co., importers.)

We have in the country what we call drawing factories. Therse small factories are established in the villages, in sections where it is possible to get drawing help; the help comes into the drawing factories and draws the bristles into the brushes in those

The quantity produced is not shown, as under the limitations imposed by the census act it was not possible to require manufacturers to state the quantity of their output in detail. A number of firms, whose production covered about one-third of the value of the total output, however, reported the number of brushes they made, and the value per dozen computed on their returns is as follows: Household and trade brooms and brushes, $1.28; painters', decorators', and whitewashers' brushes, $4; fancy and toilet brushes, not of bone, $3.60; bone brushes, $0.97; and machinery brushes, $5.56. In the following table the value of the output is given for the various branches of the trade.

Value of production of brushes in Great Britain, 1907.

[Figures from Census of Production, Great Britain, 1907.][1]

	England, Wales, and Ireland.	Scotland.	United Kingdom.
Household and trade brooms and brushes	$4,574,510.00	$316,322.50	$4,890,832.50
Painters', decorators', and whitewashers' brushes	1,635,144.00	145,995.00	1,781,139.00
Fancy and toilet brushes (not of bone)	807,839.00	4,866.50	812,705.50
Bone brushes	457,451.00	.....	457,451.00
Machinery brushes	452,584.50	34,065.50	486,650.00
Brushes not separately distinguished	223,859.00	.....	223,859.00
Total brushes	8,151,387.50	[2] 501,249.50	8,652,637.00
Stock, handles, etc	92,463.50	.....	92,463.50
Other products	111,929.50	.....	111,929.50
Total value of goods made	8,355,780.50	501,249.50	8,857,030.00
Amount received for work for the trade	38,932.00	.....	38,932.00
Total value of goods made and work done	8,394,712.50	501,249.50	8,895,962.00
Cost of materials used	4,443,114.50	272,524.50	4,715,638.50
Net output	3,951,598.00	228,725.50	4,180,323.50

[1] Pounds converted to United States equivalent at $4.8665 per £.
[2] Does not include brushes to the value of $121,552.50 returned on schedules for other trades and $24,332.50 made in philanthropic institutions.

AUSTRIA-HUNGARY.

Very little descriptive material is available in regard to the brush industry in Austria-Hungary. As in other brush-producing countries of Europe, much of the work is done by hand not only in homes but in the factories as well. Austria makes use of machinery, however, in the production of toilet brushes. The automatic toothbrush boring and filling machine was invented in Austria. The patent rights were purchased by an American concern, which has since developed and improved the original type. Austria uses pyroxylin plastics as well as bone in the manufacture of toothbrushes: the former material is better adapted to the use of automatic machinery than the latter.

JAPAN.

The brush industry in Japan has been in existence a little over a quarter of a century. An enterprising American, realizing the advantages that Japan offered in the way of abundant and cheap labor, began the manufacture of brushes in that country in 1891. Training the workers to become skilled artisans and finding a market for the product were the chief difficulties in establishing a trade.

is not observed as holiday, but the four holidays in each month usually fall on the first day of the week. For the drawing that is given out to be done in the country, there are no regular working hours. Families including small children, engaged on this kind of work, do it when not occupied with their small farms, chiefly on rainy days and at night.

In regard to Government assistance in the brush industry, Mr. G. S. Gibson an importer, states that the Japanese Government does not subsidize brush manufacturers.

Imports and exports.—Statistics of imports of brushes are not shown in official publications. There is not much of a market for good brushes in Japan, even for the domestic producers Japanese hotel managers supply a cheap toothbrush, which is used but once and then thrown away. Round and flat paint brushes, however, are imported, as are various household brushes, which up to the present time (1918) have not been produced to any extent.

Practically all of the better grades of brushes made in Japan are exported. For the 10 years 1907 to 1916, the value of toothbrushes exported ranged from 24 to 29 cents per dozen; hairbrushes from $1.42 to $2.30 per dozen; nail brushes 34 to 58 cents per dozen; and clothing brushes $0.85 to $1.60 per dozen. The United States is Japan's best customer. In only one year since 1907 has the United States taken less than 40 per cent of the total value of brushes exported by Japan. The percentage fell to 33.18 in 1915. In these years Japan increased the percentage of exports to Great Britain and other countries, because of the activities of British agents in making purchases for their Government and because of the decrease in exports by the brush-producing countries of Europe. In 1919 the total value of all brushes exported to all countries amounted to $5,128,404, divided as follows: Toothbrushes, 5,554,228 dozens, valued at $3,255,426; hairbrushes, 370,056 dozens, valued at $1,160,340; nail brushes, 285,936 dozens, valued at $170,814; clothing brushes, 56,304 dozens, valued at $166,830; all other brushes valued at $374,994. The following tables give statistics of production for the years 1906 to 1918, inclusive, and of exports for the years 1907 to 1919, inclusive.

Quantity and value of brushes produced in Japan, 1906–1918.[1]

Year.	Number of factories or workshops.	Employees.			Total brushes.	
		Total.	Male.	Female.	Quantity (dozens).	Value.

Rates of duty and tariff classifications under tariff acts of 1883, 1890, 1894, 1897, 1909, and 1913.

Act of—	Par.	Classification or description.	Rates of duty ad valorem.
			Per cent.
1883	404	Brushes of all kinds	30
1890	427	Brushes * * * of all kinds, including feather dusters and hair pencils in quills	40
1894	314	Hair pencils, brushes, and feather dusters	35
1897	410	Brushes, * * * and feather dusters of all kinds and hair pencils in quills or otherwise	40
1909	423	Brushes, * * * and feather dusters of all kinds, and hair pencils in quills or otherwise	40
1913	336	* * * brushes and feather dusters of all kinds and hair pencils in quills or otherwise	35

Review of Tariff Laws.

BRISTLES.

With one exception, the duties on bristles, when enumerated in the tariff acts, have uniformly been specific. The minimum rate is 1 cent per pound; the maximum 15 cents per pound. In the act of 1846, which imposed ad valorem duties exclusively, the rate was 5 per cent. In 1857, in a general reduction made without specification of articles, this rate was reduced to 4 per cent ad valorem.

In the act of 1804 bristles of swine and in the act of 1841 bristles of all kinds were admitted to free entry. Since the act of 1890 a distinction has been made between bristles, crude or not sorted, bunched, or prepared, and those advanced in condition. The former have been exempt from duty and the latter dutiable at 7½ cents per pound, except under the act of 1913, which reduced the rate to 7 cents per pound.

BRUSHES.

Duties upon brushes, on the other hand, have always been ad valorem. The rate has varied from 7½ per cent in 1789 to 40 per cent in 1864, 1890, 1897, and 1909. Thirty per cent was imposed in the acts of 1816, 1842, 1846, 1861, and 1883, and 35 per cent in 1862, 1894, and 1913. In 1883 hair pencils, and since then hair pencils and feather dusters, have been classified with brushes at the same rate of duty.

The provision for bristles and brushes in the tariff act of October 3, 1913, are as follows:

BRUSHES.

Par. 336. * * * brushes and feather dusters of all kinds, and hair pencils in quills or otherwise, 35 per cent ad valorem.

BRISTLES.

Par. 337. Bristles, sorted, bunched, or prepared, 7 cents per pound.
Par. 432, crude, not sorted, bunched, or prepared. Free.

Abstract of Treasury and Court Decisions Relating to Brushes.

BRISTLES AND OTHER MATERIALS FOR BRUSHES.

BRISTLES.

Under the system of partial revision from time to time in tariff legislation prior to 1883 hog's bristles, which were separately classified in the act of 1864, were held not included in the general clause in the act of 1872 for hair of animals. (Von Stade *v.* Arthur, 28 Fed. Cas , 1274.)

But hogs' or pigs' hair, not commercially known as bristles, was held to be free of duty as animal hair under the act of 1890. (In re Irsch, G. A. 1448, T. D. 12852.)

Bristles sorted, bunched, or prepared in any manner were first separated from bristles not so advanced in the act of 1894. Under that act bristles in bunches were held dutiable as bristles bunched and not exempt from duty as crude. The provision was declared not limited to bristles prepared for brush makers' use. (In re Lewisohn, G. A. 2993, T. D. 15969.)

Under subsequent litigation bristles tied in bunches with their butt ends lying together in preparation for brush makers' use were held to be bunched or prepared. The distinction was declared to be between absolute crudeness and advancement of one or more steps in preparation for the arts. Both sorting and bunching were adjudged unnecessary, subjection to either process being deemed sufficient. (Pushee *v.* United States, 158 Fed., 968, T. D. 28782, affirming 155 Fed., 265, which affirmed G. A. 5483, T. D. 24797.)

But uncleaned, unassorted bristles tied up in tufts or small bunches the "root" and "flag" ends mixed indiscriminately either way were exempt from duty as crude. (In re Woll, G. A. 4297, T. D. 20213.)

The provision in the act of 1909 for bristles sorted, bunched, or prepared was construed not to include pigs' bristles dyed and mounted on wire in the form of pompons or aigrettes and used for millinery purposes, which were classified as artificial or ornamental feathers by similitude. (In re Stewart Hess Co., Abstract 32296, T. D. 33409; followed in Abstract 35453, T. D. 34416.)

In recent cases, the corresponding provision in the act of 1913 was held to require such sorting, or bunching, or preparation as tends in some way toward preparing the bristles and to exclude mere bunching irrespective of length of bristles or size of bunches. (In re Cedar, Abstract 37886; followed in Abstracts 37999 and 38366.)

An importation classified by the collector as waste under this act was held to be exempt from duty as bristles, crude, not sorted or prepared. (In re Perry, Abstract 38178.)

OTHER MATERIALS.

Of other materials for brushes, bass, not manufactured or advanced in any manner except by cutting into lengths and putting into bunches for convenience of shipment, was held exempt from duty under the provision in the act of 1883 for dried fiber and stems in a crude state

not advanced in value or condition by a process of manufacture. (Appeal of P. Woll & Sons, T. D. 6593.)

A mixture of hogs' hair and bristles in equal parts, the hair not curled, was held dutiable as bristles under the act of 1883 and not free under the provision for hair of hogs curled for beds or matresses and not fit for bristles. (Appeal of P. Woll & Sons, T. D. 8667.)

But a mixture of bristles with goat hair in the proportion of 80 to 20 per cent was held dutiable under the act of 1897 as bristles, directly or by similitude. (In re Cone, Abstract 17686, T. D. 28626.)

Feather bristles, so-called, manufactured from quills, were held dutiable under the same act as unenumerated articles and not directly or by similitude as bristles. (In re Wilkens, G. A. 5861, T. D. 25821.)

Merchandise invoiced as "dachshaar imitation" and classified as an unenumerated article was held dutiable by similitude as bristles sorted, etc. (In re Knauth, Abstract 21282, T. D. 29790.)

Cocoa fiber dressed, cut into uniform lengths, and bunched ready for use in the manufacture of brushes was held dutiable under the act of 1909 as unenumerated articles partly manufactured and not exempt from duty as crude cocoa fiber. (United States *v.* Flatt, 5 Ct. Cust. Appls., 210, T. D. 34379, reversing Abstract 33808, T. D. 33789, which follows Abstract 30026, T. D. 32858, holding bass fiber cut into lengths exempt from duty as crude.)

BRUSHES.

Powder puffs have several times been the subject of decisions. Under the Revised Statutes of 1874, they were held dutiable as brushes. (Appeals of McKesson & Robbins et al., T. D. 3028 and 3114; also under the act of 1890; in re Shoemaker et al., G. A. 1731 T. D. 13351 and G. A. 2034, T. D. 13881.) But in a court case under the act of 1897 they were held not to be brushes in the tariff sense because while like brushes in use they do not resemble them in construction or material and hence are dutiable as manufactures of wool. (United States *v.* Borgfeldt, 153 Fed. 480, T. D. 28142; followed in G. A. 6611, T. D. 28222.)

Miniature brushes imported with fans, furs, jewelry, or combs, known in commerce collectively as dolls' wardrobes, were held dutiable as toys under the act of 1864. (T. D. 569.)

But diminutive paintbrushes or hair pencils in quills, flimsily constructed and designed for the amusement of children were held dutiable under the act of 1890 as "brushes" or as "hair pencils in quills" as more specific than "toys." (In re Rogge, G. A. 1053, T. D. 12239.)

Doll hairbrushes 4 inches long and not unfit for practical use have also been held dutiable as brushes rather than as toys. (In re Davis, G. A. 3777, T. D. 17843.) This decision was under the act of 1894.

Miniature feather dusters, not adapted to use by children any more than by grown persons on gala occasions, held, in default of proof of commercial designation as toys, to come within the provision for 'feather dusters of all kinds." (United States *v.* Scheuer, 4 Ct. Cust. Appls. 37, T. D. 33224, reversing Abstract 29881, T. D. 32842.)

OTHER DECISIONS UPON BRUSHES.

REVISED STATUTES.

Scratch brushes of brass were held dutiable under the provision for brushes of all kinds in the Revised Statutes and not as manufactures of brass. (Appeal of Kearney & Swartchild, T. D. 5519.)

ACT OF 1883.

Brushes in sets with hand mirrors were held dutiable as brushes where the values are separately stated; otherwise by component material of chief value. (Appeal of Vergho, Ruhling & Co., T. D. 6174.)

But toothbrush sets, consisting of brush and stand, were held dutiable as an entirety and not separately as brushes and articles manufactured in part of iron, respectively. (Appeal of Schlessinger & Mayer, T. D. 8779.)

Feather dustbrushes were held dutiable as brushes and not as feathers manufactured. (Appeal of John of Schillito Co., T. D. 7015.)

Hair pencils with wooden or iron handles used by surgeons as swabs and known commercially as throat brushes were held dutiable as brushes. (Appeal of Lehn & Fink, T. D. 8696.)

Sink brushes were held dutiable as brushes and not as brooms. (Appeals of various persons, T. D. 8999.)

ACT OF 1890.

Flesh brushes or flesh gloves of horsehair and linen, or of horsehair and wool, horsehair chief value, held dutiable as brushes and not as manufactures of animal hair. A handle was declared not essential to a brush. (In re Schieffelin, G. A. 1313, T. D. 12664.)

The rule governing the marking of hairbrushes to indicate the country of origin is whether they are usually or ordinarily marked as a class and not whether particular shipments are marked. (Dept. order, T. D. 13042.)

Quills filled with toothpowder and invoiced as toothbrushes were held dutiable as toilet preparations and not as brushes. (In re Kwong Lung Yuen, G. A. 1628, T. D. 13207.)

Penwipers made of circular pieces of woolen cloth and flannel stitched together in the center and surmounted with grouped figures of pigs and cats, the figures composed of leather and cotton velvet, respectively, were held not to be brushes, and dampeners having a wedge-shaped piece of india rubber about 2 inches long, in place of hair or bristles, and the width of the brush, fastened in the stocks thereof, used in wetting the leaves of copying books and known as copying book brushes, were held to be brushes. (In re Lippincott Co., G. A. 1946, T. D. 13752.)

Crumb trays and brushes invoiced as entireties were held separately dutiable at 40 per cent upon the value of the brushes and 35 per cent upon the value of the trays. (In re Solomon, G. A. 2477, T. D. 14755.)

Steel brush ink erasers were held dutiable as erasers and not as brushes nor as manufactures of metal. (In re Faber, G. A. 2728, T. D. 15235.)

ACT OF 1894.

Haidebrooms, consisting of bunches of stiff fiber cut into uniform lengths and bound tightly with thin wooden strips, except at the lower end, were held dutiable as brooms and not as brushes. (In re Thurnauer, G. A. 2987, T. D. 15963.)

Flute swabs or brushes, used for cleaning flutes, were held dutiable as brushes and not as part of musical instruments. (In re Foote, G. A. 3133, T. D. 16304.) (See clarinet cleaners under act of 1909, infra.)

An implement for sweeping, consisting of a wooden block 15 inches long by 3 inches wide, bound around the edges with flannel or felt, pierced on one side for a handle and having on the other side woolen strips, held to be a brush and not a broom. (In re Lewis, G. A. 3897, T. D. 18140.)

ACT OF 1897.

Dynamo brushes of metal and used for collecting and transmitting electric currents were held dutiable as articles of metal and not as brushes. (In re Michigan Electric Co., G. A. 5390 T. D. 24593.) Carbon brushes in litigation under the act of 1909 were not claimed to be dutiable as brushes of the class herein under consideration. They were held dutiable as brushes composed wholly or in chief value of carbon. (Abstract 23255, T. D. 30601.)

Dusters composed of a wooden handle to which were attached many strips of woolen cloth, commonly known as "list," were held dutiable as manufactures of wool and not as brushes, brooms, or feather dusters. (In re Melon, G. A. 5551, T. D. 24937.)

Paintbrushes packed in separate cartons in the same case with oil colors in tubes and with water colors in pans, and invoiced separately, were held not dutiable at the rate applicable to the paints, which, with the brushes, did not constitute an entirety in the condition in which they were imported, nor were they dealt in as such. The brushes were accordingly classified separately. (In re Weber, G. A. 6007, T. D. 26246, distinguishing G. A. 5984, T. D. 26209, holding boxes of tin or wood containing water-color paints, porcelain dishes, and three small brushes dutiable as entireties, because dealt in by the trade exclusively as paints.)

Buffing sticks, composed of a strip of pine upon which was fastened a piece of leather, leather of chief value, were held dutiable as manufactures of leather and not as brushes. (In re Sheldon, G. A. 6656, T. D. 28383.)

ACT OF 1909.

Round wooden sticks about 18 inches long, having at one end a whisk effect produced by small shavings of the stick turned down and bound together, were held dutiable as manufactures of wood and not as brushes or brooms. (United States *v.* Sheldon, 4 Ct. Cust. Appls. 330, T. D. 33524, affirming Abstract 30952, T. D. 33055.)

Twigs of willow, closely bound together in bunches securely fastened at one end, and of substantial strength and apparent durability, were held to be of a class of brushes known as whisk brooms and not dutiable as manufactures of wood. (United States *v.* Swedish Produce Co., 4 Ct. Cust. Appls. 331, T. D. 33525, reversing Abstracts 31031, T. D. 33088 and 31380, T. D. 33217.)

A hairbrush fitted with a compartment holding a comb, pyroxylin in chief value, was held dutiable as an article in chief value of pyroxylin under paragraph 17 and not as a brush. (In re Langsdorf, Abstract 37676.)

Clarinet cleaners, consisting of twisted wire and yarn or threads running nearly at right angles with the wire, were held dutiable as brushes. (Dept. order, T. D. 32512.) (See flute swabs under act of 1894, supra.)

ACT OF 1913.

Brass scratch brushes used for polishing gold and jewelry, were held to be within the provision for brushes of all kinds and not dutiable as wire under paragraph 114. (In re Worthington, Abstract 36472, T. D. 34763.)

A patent rotary wire brush 92 inches in length and with four rows composed of phosphor-bronze bristles 1 inch wide projecting three-fourths of an inch, set spirally in a wooden stock 4 inches in diameter, with a shaft 1½ inches in diameter projecting 12 inches, used in connection with an apparatus for cleaning the Fourdrinier wire of a paper-making machine, was held to be a brush within the meaning of paragraph 336. (In re Castle, Abstract 37023, T. D. 34984.)

Brushes for bottle-washing machines were held dutiable as brushes and not as a part of the machines with which they were imported as entireties. (In re Wirth, Abstract 38221.)

An oval rubber mat in which was set with glue, cement, or other adhesive material, bristles of the length and character of those in a hairbrush, and intended to be glued into a wooden handle, thus constituting a hairbrush, was held to fall within the provision for brushes of all kinds, directly or by similitude, and not dutiable as an unenumerated manufactured article. (In re Borgfeldt, Abstract 40862.)

Toothbrushes and bamboo baskets containing cardboard trays in which the toothbrushes were packed, the baskets used upon the counters of retailers to display the toothbrushes, were held dutiable under paragraph 175 and paragraph 336 of the act of 1913, the baskets being treated as unusual coverings. (Abstract 43037, of 1919, following G. A. 7592, T. D. 34676, of 1914, relative to showcases filled with pipes and to be subsequently refilled.)

Boot wipers consisting of an iron stand and two brushes were held dutiable as entireties at the rate applicable to the component article of chief value. (G. A. 7802, T. D. 35846, of 1915.)

Merchandise invoiced as "reversible cotton bath pads" and "cotton bath straps" and composed of cotton and loffah, classified as brushes under paragraph 336 of the act of 1913, was found not to respond to the definition of brushes, but as the component material of chief value was not shown, the protest was overruled. (Abstract 41242, of 1917.)

PREFACE

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission. These surveys deal with the commodities provided for by the tariff act in force at the time of their preparation.

When articles or commodities are covered by two or more paragraphs of the tariff act they are sometimes combined in one survey. This is done only when similarity and industrial relationship are sufficient to justify a joint treatment. When one grade of an article or commodity is dutiable and another grade is on the free list, the entire treatment is effected under the dutiable paragraph.

The commission has issued as a separate pamphlet an index to all its publications. This index lists in alphabetical order the articles or commodities treated in any commission publication.

In the preparation of this survey the commission had the services of Gardner M. Youngman, of the textile division of the commission's staff, and of others.

STATISTICAL TABLES

Table		Page
1.	Summary of the woolen-goods industry of the United States, 1889–1925	111
2.	Wool used in the woolen-goods industry 1879–1919	111
3.	Quantity and value of materials used in the woolen-goods industry, 1909–1919	112
4.	Quantity and value of woven fabrics produced by the woolen-goods industry, 1914–1925	112
5.	Summary of the worsted-goods industry of the United States, 1889–1925	114
6.	Wool used in the worsted-goods industry, 1879–1919	114
7.	Quantity and value of materials used in the worsted-goods industry, 1909–1919	115
8.	Quantity and value of woven fabrics produced by the worsted-goods industry, 1914–1925	116
9.	Average hours and earnings and classified full-time hours per week of employees in woolen and worsted mills, by occupation and sex, 1910–1926	117
10.	Wage changes in the wool manufacturing industry, 1915–1925	121
11.	Activity of wool spindles in the United States, 1913–1926	122
12.	Activity of wool looms in the United States, 1913–1926	122
13.	Total imports for consumption of woolens and worsteds, 1891–1926	123
14.	Total imports for consumption of woven fabrics of wool, mohair, alpaca, etc., weighing not over 4 ounces per square yard, 1891–1926	124
14A.	Imports for consumption of dress goods of wool, mohair, alpaca, etc., weighing not over 4 ounces per square yard, 1891–1926	125
14B.	Imports for consumption of cotton warp dress goods, weighing not over 4 ounces per square yard, 1891–1926	126
14C.	Imports for consumption of dress goods wholly or in chief value of wool, weighing not over 4 ounces per square yard, 1914–1922	126
14D.	Imports for consumption of fabrics made of mohair, alpaca, etc., weighing not over 4 ounces per square yard, 1914–1926	127
14E.	Imports for consumption of wool flannels, weighing not over 4 ounces per square yard, 1891–1914	127
15.	Imports for consumption of fabrics made of wool, mohair, alpaca, etc., weighing over 4 ounces per square yard, 1891–1926	128
15A.	Imports for consumption of cloths, woolen or worsted, 1891–1926	129
15B.	Imports for consumption of dress goods made of wool, mohair, alpaca, etc., weighing over 4 ounces per square yard, 1891–1914	130
15C.	Imports for consumption of cotton warp dress goods, weighing over 4 ounces per square yard, 1891–1914	131
15D.	Imports for consumption of wool blankets, over three yards in length, 1895–1914	132
15E.	Imports for consumption of wool flannels, weighing over 4 ounces per square yard, 1891–1922	133
16.	Woolens and worsteds; relation of imports and exports to production in census years 1889–1925	134
17.	Percentage, in value, of general imports of woven fabrics of wool imported from the United Kingdom, France, Germany, Belgium, and all other countries, 1891–1925	134
18.	Domestic wools; average annual prices, per pound, in Boston, 1911–1923	135
19.	Foreign wools; average annual prices, per pound, in Boston, 1911–1923	135
20.	Domestic woolens and worsteds; average annual prices, per linear yard, of specific fabrics, 1911–1924	136
21.	Domestic woolens and worsteds; average annual prices, per linear yard, by classes, 1911–1924	138
22.	Raw wools, and woolens and worsteds; summary of average annual prices, 1911–1924	138
23.	Pile fabrics of wool or mohair; imports for consumption—Revenue, 1891–1926	139
24.	Manufactures of pile fabrics; imports for consumption—Revenue, 1914–1926	140

Table Page
25. Domestic production of wool blankets and carriage robes, 1914–1925 140
26. Wool blankets, not over 3 yards in length; relation of imports and exports to production in census years 1899–1925 140
27. Wool blankets, not over 3 yards in length; imports for consumption; revenue, 1891–1926 141

CHARTS

Trend of index numbers for wholesale prices of domestic and foreign raw wools and of domestic woolen and worsted fabrics, also of earnings per hour in the domestic woolen and worsted industries 55
Imports for consumption of woolens and worsteds, 1860–1924 59
Relation of imports and exports to the volume of the domestic production of woolens and worsteds in 1919, 1921, and 1923 71
Equivalent ad valorem rates of duty on imports of woolens and worsteds, 1860–1924 80
Duties on wool blankets and on embroideries in the tariff act of 1922 103

WOVEN FABRICS OF WOOL

SUMMARY

Scope of report.—This report covers woven fabrics of wool, other than floor coverings. It is divided into three parts. Part 1 relates to woolens and worsteds, including cloths, dress goods, flannels, and fabrics made of mohair and alpaca, dutiable under paragraphs 1108 and 1109 of the tariff act of 1922; Part 2 treats pile fabrics of wool and hair, dutiable under paragraph 1110; and Part 3 covers wool blankets and similar articles, dutiable under paragraph 1111.

Raw materials.—The United States production of raw wool in 1925, as estimated by the United States Department of Agriculture, was 301,060,000 pounds, composed of 254,260,000 pounds of fleece wool and 46,800,000 pounds of pulled wool. Australia, the principal wool-growing country, it is estimated produced 770,000,000 pounds in 1925. Argentina in 1925 outranked the United States as the second largest wool-growing country by a very narrow margin, the clip being estimated at 313,000,000 pounds. Texas is the leading wool-producing State and is followed by Wyoming and Montana.

In the manufacture of woolen and worsted goods, including pile fabrics and blankets, the consumption of wool in the United States has been as follows: [1]

Census year	In condition purchased	Scoured equivalent	Census year	In condition purchased	Scoured equivalent
	Pounds	*Pounds*		*Pounds*	*Pounds*
1889	283,009,418	155,215,840	1909	474,755,366	290,706,970
1899	330,178,552	192,705,519	1914	434,728,075	257,448,746
1904	418,703,311	241,280,065	1919	443,461,904	263,836,462

The tendency in both the woolen and worsted branches of the industry is to use a smaller proportion of domestic and a larger proportion of foreign wools. (See Tables 2 and 6, pp. 111 and 114.) Since 1899 the worsted branch of the industry has been a much larger wool consumer than the woolen branch.

Approximately 40 per cent of the mohair used is imported; imports are mainly from South Africa and Turkey. Alpaca, vicuna, and camel's hair are entirely of foreign origin. The raw cotton and cotton yarns used by wool manufacturers are mainly of domestic origin.

[1] The wool-manufactures group of five industries embraces establishments engaged primarily in the manufacture of (1) woolen goods, (2) worsted goods, (3) wool carpets and rugs, other than rag, (4) wool or hair felt goods, and (5) wool-felt hats. The above figures relate to the wool consumed in the woolen goods and worsted goods industries only.

Domestic production.—The production of woolen and worsted woven goods, including pile fabrics and blankets, is recorded by the Bureau of the Census as follows:

Census year	Quantity		Value	Unit value	
	Square yards	Pounds		Per square yard	Per pound
1899	426,572,856	----------	$183,306,655	$0.430	--------
1904	505,821,956	----------	234,737,036	.464	--------
1909	570,743,797	----------	296,447,594	.519	--------
1914	565,462,159	----------	268,679,480	.475	--------
1919	535,937,572	329,644,797	739,279,795	1.379	$2.242
1921	493,759,555	271,250,774	550,680,681	1.115	2.030
1923	628,017,509	379,207,914	745,267,669	1.187	1.967
1925	579,788,935	334,304,707	673,569,023	1.162	2.015

On the basis of a population of 90,691,000 in 1909 and 115,378,000 in 1925, the per capita production of woven fabrics of wool decreased from 6.293 square yards in 1909 to 5.025 in 1925, or 20 per cent. Imports and exports were relatively small so that the decline in domestic consumption was in about the same ratio. This decrease may be attributed to several causes, the chief among which are the use of better grades of fabrics and the increased prices, which compel the consuming public to make its wool garments last longer. Another effect of higher prices has been to shift consumption toward the lighter weight fabrics—a tendency that has been increased by the more general use of steam-heated houses. This is particularly manifest in the substitution of worsted for woolen suitings, and in the substitution of cotton and silk for wool underwear.

The worsted branch of the industry is much larger and more important than the woolen. In 1925, there were 503 woolen mills, with 67,056 wage earners, whose products were valued at $361,524,034. In the same year, 329 worsted mills, employing 98,168 wage earners, manufactured goods valued at $596,266,304. The foregoing figures are for woven fabrics including blankets and pile fabrics, and also such products as tops, yarn, noils, and wool waste made for sale. In 1923, there were 105 woolen and 156 worsted mills whose individual output exceeded $1,000,000.

The reports of idle machinery, in the wool manufacturing industry as a whole, under the operation of the tariff act of 1922 are here presented for the month of October, 1922–1926.

Month of October	Per cent idle				
	Woolen spindles	Worsted spindles	Broad looms	Narrow looms	Carpet looms
1922	16	11	23	21	17
1923	16	16	23	19	14
1924	17	25	28	24	23
1925	21	24	29	23	29
1926	21	22	32	31	34

Imports for consumption.—The passage of the tariff act of 1897 seems to mark a distinct turning point in the wool manufacturing industry. From the Civil War up to the passage of the act of 1897, imports of woolens and worsteds were rarely less than $20,000,000 per annum, but since 1897 have seldom attained that value. The average annual imports under each of the last five tariff acts and imports in the first four full calendar years under the act of 1922 are found to compare as follows:

Woolens and worsteds—Imports for consumption—Revenue acts of 1890–1922

	Average per year of 365 days		
	Value	Duty collected	Equivalent ad valorem rate of duty [1]
Tariff act of:			*Per cent*
1890	$22,719,445	$22,588,755	99.42
1894	41,341,428	20,136,973	48.71
1897	11,855,116	11,913,649	100.49
1909	10,279,852	10,074,836	98.01
1913	13,723,523	5,363,894	39.09
1922—			
Calendar year 1923	20,127,887	14,757,798	73.32
Calendar year 1924	20,481,672	15,059,683	73.53
Calendar year 1925	22,022,680	15,593,082	70.80
Calendar year 1926	21,180,044	15,090,238	71.25

[1] The equivalent ad valorem rates of duty shown under the acts of 1890, 1897, 1909, and 1922 include compensatory as well as protective rates of duty. This should be born in mind when comparing the equivalent ad valorem rates of duty under the acts of 1894 and 1913 with those under the acts of 1890, 1897, 1909, and 1922.

Considering the increase in unit values, it is obvious that in quantity annual imports under the act of 1913, the act carrying the lowest rate of duty, averaged less than under the higher rates of any of the preceding acts. This was mainly due to the World War. Imports for consumption in the fiscal year 1914 were valued at $20,093,498, as compared with a record low value of $7,780,872 in the fiscal year 1913, but abnormal conditions arising from the war obscure the effect of the new tariff act so that it is impossible to judge whether the sudden increase in value of imports beginning January 1, 1914, would have been permanent or only temporary. The decreased rate of duty allowed the entry of goods of the cheaper grades which had previously been excluded.

Excluding cotton-warp fabrics, which are mainly linings, imports are composed of woolen and worsted cloths for men's wear and fine novelty dress goods for women's wear. The demand for these fabrics is largely due to style and reputation; they do not compete with domestic fabrics on a price basis, but are used in garments that are sold at prices considerably in excess of those obtainable for garments made of comparable American cloths.

Although imports are large in themselves, their value is only a small percentage of the value of the domestic production. In the fiscal year 1914, imports constituted by value 7.85 per cent of the domestic product; in 1919, 1 per cent; in 1921, 3.14 per cent; in 1923, 2.87 per cent; and in 1925, 3.59 per cent. Woolens and worsteds imported in 1923, 1924, 1925, and 1926 exceeded in value those of any year since 1897, and were valued at $20,127,887, $20,481,672, $22,022,680, and $21,180,044, respectively. The great bulk of the import is supplied

by the United Kingdom; France and Germany are next in importance; imports from other countries are very small.

Exports.—Excluding the war years, exports of American woven fabrics of wool have always been small. In 1921, cloths and dress goods of wool and mohair were exported to the value of $4,040,988—equivalent to three-quarters of 1 per cent of the domestic production. In 1922, they were valued at $1,676,302; in 1923, at $2,346,953, in 1924, at $1,331,775, in 1925, at $1,132,971, and in 1926, at $872,235. In recent years the largest users of American cloths and dress goods have been Canada, Cuba, and Mexico.

Foreign production.—There are no reliable figures as to the foreign production of woolen and worsted fabrics, for the reason that other countries do not follow the practice of the United States in taking a census of production. Data as to physical equipment are incomplete and for several countries available only for pre-war years. From the meager data at hand the United Kingdom seems to have the largest equipment, and the United States the second largest. France is apparently third, Germany fourth, Czechoslovakia fifth, and Italy sixth. The manufacture of woolens and worsteds in Japan and Australia is small but increasing; in all other countries it is a minor industry.

Competitive conditions.—In Great Britain, material costs are lower than in the United States. The difference in price of wool in the two countries varies at different times from a half to the whole of the duty of 31 cents a pound, on the clean content, levied on imports into this country. The British manufacturer also has an advantage in the better choice of material that is permitted by the greater number of grades into which the fleece is sorted. British operatives receive lower wages than American but the relative labor cost per unit here and abroad varies according to the type of fabric. The labor cost advantage of the foreign manufacturer is greatest in fine and fancy fabrics and it is therefore natural to find that such goods constitute the great bulk of our imports rather than staples which carry a lower percentage of labor. On fabrics such as six-quarter woolens (54 to 56 inches wide) where the weaver is restricted to one loom, the foreign manufacturer has a substantial labor advantage which can be offset only to a limited degree by the methods of production in this country. Quantity production is the rule in the United States; fewer styles are made in this country and loom changes are less frequent. The greater stability of labor, with a lower labor turnover is an advantage to the foreign manufacturer. Overhead charges such as salaries, supplies, fuel and power, are lower abroad than in the United States, and mill construction and machinery are cheaper.

The domestic manufacturer of woolens and worsteds sells in the market of the highest price level and in one which has a greater consuming capacity than any other country. Other factors which favor the American manufacturer are newer machinery, better working conditions through the arrangement of machinery to give wider alleys, the installment of modern lighting systems, and more efficient management in various ways. For some types of staple worsted the American mills are installing automatic looms and giving 6 to 12 to a weaver.[2] This innovation probably will be adopted

[2] Automatic looms will run continuously unless a filling or warp thread breaks, in which case it is automatically stopped by the operation of the filling or warp-stop motion. When the filling runs out a full bobbin is automatically inserted without assistance from the weaver.

much more slowly in Great Britain, owing to the greater conservatism of the manufacturers and the opposition of labor unions.

Prices.—In the years 1911, 1912, and 1913 the annual average price of 41 staple domestic woolens and worsteds was $1.21 per linear yard. (See Table 20, p. 136.) In 1924 these same fabrics showed an average price of $2.57 or an increase of 114 per cent. In the same period the price of domestic wools, as quoted on the Boston market, increased 121 per cent and that of foreign wools 103 per cent. (See Tables 18 and 19, p. 135.) In the woolen and worsted industries, between 1913 and 1924, earnings per hour increased 201 per cent, and full-time weekly earnings 162 per cent.

Conclusions.—Imports of woolens and worsteds entered under tariff acts carrying a compound duty [3] have been restricted almost wholly to fabrics of the finer grades. The bulk of the domestic production, on the other hand, consists of fabrics of medium quality. These goods are made into clothing and sold to the great middle class of consumers who constitute the largest market in the United States. The fabrics imported under the tariff act of 1922 do not compete on a price basis with comparable domestic cloths. Comparable fabrics of foreign and domestic manufacture, on file with the United States Tariff Commission, show the following wholesale selling prices in New York in June, 1923. The imported fabrics all paid a duty of 45 cents a pound and 50 per cent ad valorem.

Comparable domestic and foreign worsteds—Wholesale prices in the United States in June, 1923

Fabric	Domestic fabrics			British fabrics		
	Style	Weight per linear yard	Wholesale price in New York [1]	Style	Weight per linear yard	Wholesale price in New York [2]
		Ounces			*Ounces*	
Worsted serge	100A	10.7	$2.67½	100F	10.9	$3.82½
Do	101A	13.2	3.20	101F	13.7	4.52½
Do	102A	13.5	3.49	102F	12.0	4.67½
Cotton-filled gabardine	103A	13.7	3.12½	103F	12.9	4.12½
Do	104A	11.8	2.62½	104F	10.7	3.40

[1] Less 10 per cent in 30 days. [2] Less 3 per cent in 30 days.

To the average consumer, each of the domestic and the imported fabrics compared in the above table would be identical in appearance. In fact, they proved upon analysis to be approximately the same in type of wool used, yarn numbers, construction, and weight. Nevertheless, the imported fabrics sold at much higher prices simply because they were imported. In general, it can be said that imported fabrics of wool sell on the American market at higher prices than the nearest comparable domestic fabrics. The domestic cloths are sold mainly to the manufacturing clothier, while the bulk of the imported fabrics are consumed by merchant tailors.

The machinery in American woolen and worsted mills is more than sufficient to supply the domestic market and there is keen competition between domestic manufacturers. Imports of woven fabrics of wool

[3] The tariff acts of 1890, 1897, 1909, and 1922.

are due mainly to quality or reputation. The domestic mills are engaged mainly in the mass production of medium grade goods and on these they control the home market. The smaller demand for fine quality fabrics is supplied partly by American and partly by foreign mills.

An analysis of imports of woolens and worsteds entered under paragraphs 1108 and 1109 of the tariff act of 1922 shows that practically all fabrics enter under the highest value brackets; i. e., at more than 80 cents a pound. This indicates a maladjustment of value limits at the present level of prices. Three-eighths blood wool was selling in London in July, 1925, at 82 cents per pound and half-blood at 95 cents, clean content. Allowing for waste in manufacture, their cost to the manufacturer in the finished fabric was at least a fourth higher. Assuming other costs to be equal to the material cost, it would appear that few British fabrics can be produced of all wool at less than $2 per pound. The average value of woolens and worsteds entered under paragraphs 1108 and 1109 in 1924 was $1.80 and in 1925, $2.07 per pound. On the basis of the above figures it would appear that the compensatory duty on fabrics between 80 cents and $2 per pound includes a substantial amount of incidental protection, inasmuch as such fabrics must be made in part of wool substitutes, and yet they obtain the full compensatory duty of 45 cents per pound of the wool content, on the assumption that all the wool contained in them is "virgin" wool dutiable at 31 cents per pound.

The compensatory duties of the tariff act of 1922 were computed on the basis of data compiled by the Tariff Board in 1911. The greatly increased cost of materials, however, throws the present value classifications out of adjustment and does not allow cloths of medium and low grades to be entered on a parity with those made of the higher grade wools. In 1925 wool cloths, weighing more than 4 ounces a square yard, valued at not more than 60 cents per pound paid an equivalent ad valorem rate of duty of 83.77 per cent; those valued at more than 60 cents but not more than 80 cents a pound paid 104.80 per cent; and those valued at more than 80 cents a pound paid only 70.90 per cent.

PART 1

WOOLENS AND WORSTEDS

CHAPTER 1

[Text of the tariff act of 1922 providing for woolens and worsteds]

Par. 1108. Woven fabrics, weighing not more than four ounces per square yard, wholly or in chief value of wool, valued at not more than 80 cents per pound, 37 cents per pound and 50 per centum ad valorem; valued at more than 80 cents per pound, 45 cents per pound upon the wool content thereof and 50 per centum ad valorem: *Provided*, That if the warp of any of the foregoing is wholly of cotton or other vegetable fiber, the duty shall be 36 cents per pound and 50 per centum ad valorem.

Par. 1109. Woven fabrics, weighing more than four ounces per square yard, wholly or in chief value of wool, valued at not more than 60 cents per pound, 24 cents per pound and 40 per centum ad valorem; valued at more than 60 cents but not more than 80 cents per pound, 37 cents per pound and 50 per centum ad valorem; valued at more than 80 cents but not more than $1.50 per pound, 45 cents per pound upon the wool content thereof and 50 per centum ad valorem; valued at more than $1.50 per pound, 45 cents per pound upon the wool content thereof and 50 per centum ad valorem.

DISTINCTION BETWEEN WOOLENS AND WORSTEDS

The terms "woolens" and "worsteds," which are used in the industry to denote articles manufactured by separate and distinct processes, do not appear to have any special significance to the general public. In popular writings the word "woolen" is often applied indiscriminately to all fabrics made of wool. The ordinary retailer handling such fabrics would doubtless be unable to explain the essential difference between a woolen and a worsted. In chapters 2 and 3 the two fabrics are clearly distinguished and the processes of manufacture used in making each are discussed in detail, but it is pertinent to state here briefly the distinguishing characteristic of each.

The line of demarcation between woolens and worsteds is first drawn in the selection of the raw material. In the woolen trade short wools, technically known as "clothing wools," are used, whereas in the worsted trade fibers of sufficient length to enable them to be combed are necessary; hence the raw material used in the worsted branch is described as "combing wools." From this stage forward the methods employed in converting the wool into cloth are quite different, and therefore a woolen fabric differs materially in the essential characteristics from a worsted cloth.

Since the invention of the "French" as distinguished from the "Bradford" process of combing wool, the line between clothing wool and combing wool is not so sharply drawn. Shorter fibers can be used in producing worsted yarn with the French system than with the Bradford system. The same grade of wool could be used to produce a French-spun worsted yarn as a woolen yarn; the fabrics, however, would be very different.

In woolen manufacture the object is so to manipulate the fibers passing through the machinery that they become inextricably mixed in crisscross fashion, the resultant yarn containing the longest and shortest fibers in a blend uniformly worked in to present a level and uniform thread. It is in the woolen branch of the industry that wool wastes, noils, shoddy, and other wool substitutes and cotton can be carded together with wool into one yarn.

In the worsted section, the preliminary processes have for their object the elimination of the shorter fibers and the arrangement of the longer fibers in a parallel position, as distinct from the crisscross arrangement in the woolen process. A worsted yarn is composed of nothing but "virgin" wool with the short fibers or noils removed. When the wool has been passed through the worsted card it is delivered as a single strand or sliver. This card sliver is then passed through what is known as a backwashing machine, which removes all traces of dirt and grease gathered in the process of carding, and it is then ready for the combing machine. It is this machine, of which there are several types, that produces the combed sliver or "tops." In combing, the short fibers, or noils, are removed and the fibers of the tops are worked into parallel position. In this form they go forward to the spinner to be spun into yarn, usually on a frame when combed by the Bradford system or on a worsted mule when combed by the French system.

Typical woolen fabrics are cassimeres, cheviots, meltons, kerseys, homespuns, tweeds, and flannels. Typical worsteds are serges, unfinished worsteds, fancy worsted suitings, gabardines, poplins, and Poiret twills.

Imports consist mainly of fine woolens and worsteds for men's wear and novelty goods for women's wear. Linings are also imported; these are usually made with a cotton warp and with mohair or alpaca filling spun on the worsted system.

CHAPTER 2

THE DOMESTIC WOOLEN GOODS INDUSTRY

HISTORY

The history of the American woolen goods industry may be considered in four main periods. The first is the period of early growth of the factory type of industry. The preparation, spinning, and weaving of wool had been carried on as household occupations almost from the beginning of the colonial period. Its transition to a factory basis was gradual. The American woolen industry as a factory industry began with the undertaking of power carding. The Hartford Woolen Manufactory (1788) of Hartford, Conn., although perhaps not the earliest American woolen mill, is the earliest for which there is authentic description of equipment. This equipment included "two carding engines working by water"; otherwise the equipment apparently was operated by hand.

The second period was characterized by a general spread of the factory type of industry; during this time the characteristic mill was an independent, small mill operated by water power. The

principal products were plain, staple fabrics. Progress toward the development of a real woolen industry came through the work of the Scholfield brothers. Between 1794 and 1814 they established nine factories in various parts of New England and successfully introduced a number of imitations of English machines. The restrictions placed on merchant trade with Europe by the embargo of 1808 and the War of 1812 forced many New England business men to turn from shipping and trading to manufacturing. The manufacture of woolens was conspicuous among the industries undertaken and during this period the industry grew substantially. Such factories as were in operation at the close of the War of 1812–1815 found themselves unable to compete with the large quantity of British goods coming over, and the tariff of 1816, which amounted to 15 per cent on raw wool and 25 per cent on woolen goods, did not offer much encouragement to the domestic manufacturers to renew the unequal struggle between the poorly equipped and inadequately manned industry in America, on the one side, and the well equipped and skillfully manned industry of England, on the other. After the crisis of 1819 the industry revived, and between that time and 1828 it made rapid progress, with the exception of a setback following the crisis in the British industry in 1825, which led to further dumping of woolen goods into the United States. Power was applied to the operation of looms in the United States during this period. This advance in the operation of woolen looms, it is said, took place here before it did in England.

The characteristic woolen mill up to the time of the Civil War was the small plant, fully integrated. It had wool scouring, carding, spinning, weaving, dyeing, and finishing equipment, and produced plain woolens. In the early part of this period the products were mainly broadcloths, while in the latter years cassimeres and similar fabrics became more prominent. Most of these mills were located so as to make use of small water powers. New England, the Middle Atlantic States, and even the Middle West, were dotted with such mills when the Civil War began. The census of 1860 reported 1,260 woolen mills in operation, with products valued at $61,800,000.

The third period included the Civil War and the years immediately thereafter, when the war market dominated the growth of the industry. This period showed not only a great increase in the number of mills but also a wide diversification of products. The Civil War created an enormous demand for blankets and "army cloths," and to the establishment of mills to meet this demand, more than to any other one cause, was due the increase in the woolen industry in the next decade. The census of 1870 reported 2,891 woolen mills in operation, producing over $155,000,000 worth of fabrics. From that time until 1914 the census figures show a decrease each decade in the number of mills and since 1879 a decrease in the value of products, except for the year 1904, when fashion temporarily gave a new impetus to woolen manufacturing.

The fourth period was one of centralization and decline, mainly characterized by the closing of hundreds of small mills, and the general giving way of woolen fabrics to worsteds as the popular cloths for wearing apparel.

The census of 1914 reported 501 woolen mills in operation and a product valued at $103,815,905. The World War caused a demand for woolen cloths and blankets for military uses. The census of 1919

reported the first increase in the number of woolen mills in 50 years; 560 establishments were reported with a total output valued at $364,896,590. The census of 1921, however, again showed a decline in the number of plants and in value of product; 493 establishments reported an output valued at $230,945,000. This decrease in the value of products was largely due to the fact that the census of 1921 was taken during a period of severe depression. In 1923, 513 woolen mills were reported with products valued at $364,287,817, an increase over 1921 of 58 per cent. In the same period the worsted industry showed an increase of only 33 per cent. The increased activity of the woolen mills as compared with the worsted industry was not caused altogether by a temporary shift of fashion to woolen fabrics, however, but was largely due to the fact that the labor and material costs of the latter are, as a rule, lower than those on worsteds. Woolens can be manipulated and manufactured "to meet a price," whereas worsteds are more nearly standardized in construction and can not be cheapened by the admixture of reworked wool and other substitutes.

GEOGRAPHICAL DISTRIBUTION

Within recent years the number of small country woolen mills has greatly diminished and the woolen industry has become centered in a very few places. In 1923, seven States made over 75 per cent of the total product of the woolen mills of the country. Massachusetts, in 103 mills, turned out over 25 per cent of the country's woolens. Lawrence, Mass., Philadelphia, Pa., and Providence, R. I., are the principal woolen manufacturing cities.

In 1923 the 513 establishments engaged in the woolen business were located as follows: 103 in Massachusetts; 94 in Pennsylvania; 51 in Maine; 38 in Connecticut; 37 in New Hampshire; 22 in Rhode Island; 21 in New York; 17 each in Vermont and Wisconsin; 12 in Ohio; 10 each in New Jersey and Michigan; 9 each in Virginia, Indiana, and Minnesota; 7 each in Oregon, West Virginia, North Carolina, and Tennessee; 5 in Illinois; 4 in Kentucky; 3 each in Maryland, California, Iowa, and Georgia; 2 each in Utah and Washington; and 1 in Missouri.

ORGANIZATION AND EQUIPMENT

In 1889 the woolen industry was capitalized at $130,989,940, and in 1919, at $273,973,670. During this period the number of mills was reduced from 1,311 to 560. The corporate form of ownership prevails; in 1914, 77.4 per cent of the mills were owned by corporations and in 1919, 87.7 per cent.

The average number of wage earners in the woolen branch steadily decreased from 1889, when there were 76,915 employees, to 1921, when there were only 56,434. The biennial census of manufactures for 1923 reported 72,408 wage earners and in 1925, 67,056. In the period 1921–1923 the woolen employees increased 28 per cent, whereas the employees in the worsted industry increased only 15 per cent. As previously stated, the impetus given the woolen branch of the industry in 1923 was mainly caused by the excessively high prices of wool which helped the sale of woolens in preference to worsteds. In the

period 1923–1925 woolen employees decreased 7 per cent and worsted employees 20 per cent.

In 1923, 175 woolen mills, out of a total of 513, had products valued at from $100,000 to $500,000; 138 from $500,000 to $1,000,000; and 105 had products valued at over $1,000,000.

The machinery equipment of the woolen goods industry in 1919 and 1925 was as follows:

	1919	1925		1919	1925
Cards, total number	[1] 4,618	[1] 4,563	Looms, total number	29,894	31,255
Woolen [2]	4,503	4,498	Power	29,890	31,190
Worsted	20	27	Broad (64 inches or over)	21,037	24,601
Cotton	95	43	Automatic	(4)	5,143
Spindles, total	1,888,213	2,021,957	Nonautomatic	(4)	19,458
Woolen [3]	1,853,014	1,897,145	Medium (50 to 64 inches)	1,596	645
Worsted	20,371	101,580	Automatic	(4)	267
Cotton	14,828	23,232	Nonautomatic	(4)	378
Mule spinning	1,764,133	1,830,958	Narrow (under 50 inches)	7,257	5,944
Woolen [3]	1,761,433	1,827,058	Automatic	(4)	747
Worsted	2,700	3,900	Nonautomatic	(4)	5,197
Cotton			Hand	4	65
Frame spinning	48,432	97,523	Wool-combing machines	26	80
Woolen [3]	23,513	5,313	Braiding machines	2	17
Worsted	12,311	68,978	Pickers	954	849
Cotton	12,608	23,232	Garnett machines	126	101
Doubling and twisting	75,648	93,476			
Woolen	68,068	64,774			
Worsted	5,360	28,702			
Cotton	2,220				

[1] Sets of cards.

[4] Figures not available.

MATERIALS USED

The materials used in the woolen-goods industry are wool; mohair, camel, alpaca, and vicuna hair; cattle hair; cotton; recovered wool fiber or shoddy; and noils and other by-products of wool, mohair, and camel hair.

In 1879 the woolen industry consumed 197,524,955 pounds of wool, in condition purchased. Thereafter, until 1914, each successive census showed a decline, with the one exception of 1904, when the fashions then in vogue temporarily stimulated the production of woolen fabrics. In 1914, only 78,873,319 pounds were consumed, and in 1919, 105,792,290 pounds. The decline in the amount of wool consumed in the woolen industry from 1879 to 1914 was mainly due to the demand for worsted instead of woolen fabrics. As shown in Table 2 (see Appendix, p. 111), the proportion of foreign wools used in the industry increased from 10.4 per cent in 1879 to 39.6 per cent in 1919. Prior to the act of 1922, specific duties levied on raw wools were based on the wool in the grease. Such specific duties bore more heavily on wools in which the shrinkage was greatest, and it is the heavy shrinking wools that are more generally used in the manufacture of woolens. The act of 1922 levied a duty of 31 cents per pound on the clean content, and thereby abolished the discrimination against heavy-shrinking wools.

A study of the materials used in the woolen-goods industry (see Table 3, p. 112), indicates a demand on the part of the purchasing public for higher grade woolen fabrics. From 1909 to 1919 [1] the

[1] In the biennial census figures of 1921 and 1923 the materials used are not stated and the figures for 1925 are not available.

quantity of cotton used in the manufacture of woolens decreased 7.4 per cent and cotton yarn 23.9 per cent. The use of animal hair decreased 31.2 per cent. Noils, and other by-products of wool, which are not necessarily detrimental to woolen fabrics, increased 69.6 per cent in quantity, and 275.2 per cent in value. The proportion of recovered wool fiber to the amount of wool consumed increased, however, from 23 per cent in 1909 to 30 per cent in 1919. This was partially caused, no doubt, by the large amount of shoddy used in the manufacture of woolen cloths and blankets during and immediately after the war.

METHODS OF PRODUCTION

The chief stages in the manufacture of woolen fabrics are successively as follows:

1. Wool scouring.
2. Carding.
3. Spinning.
4. Weaving.
5. Dyeing.
6. Finishing.

1. *Scouring.*—The fleece as it is clipped from the sheep's back is full of dirt, burrs, and other foreign substances, and the natural exudations from the skin of the animal. The last mentioned are mainly wool fat and yolk or suint. The scouring process frees the wool from all these impurities and leaves it clean and ready for carding. The dirt and other foreign matter are removed by mechanical washing. The suint is soluble in pure warm water, but the fat must be specially treated. The ordinary treatment is the use of detergents in the water in which the wool is scoured. The action of these is partly chemical—saponifying the fats, and partly mechanical—emulsifying them and scattering them in fine particles through the water.

Another process of getting rid of the wool fats or grease is the "naphtha solvent" process, used by one of the largest worsted mills of Lawrence, Mass. The process is described by the users as follows:

> Under this process the raw unwashed wool, full not only of grease but of dirt, is subjected in a thoroughly safe and effective way to the action of the naphtha solvent. This removes the true grease of the wool, which forms a natural soap with a base of potash. Then the application of warm—not hot—water suffices to cleanse the wool of dirt and to produce a fiber with all its impurities eliminated and its strength unimpaired, perfectly adapted for combing and manufacturing.

The naphtha solvent process is patented and not extensively used.

In the ordinary method of wool scouring the combination of mechanical and chemical treatment has been so standardized as to make possible the use of machinery throughout the process. The main work of scouring is conducted in a leviathan—a series of tanks fitted with rollers, forks, and elevators. There are also rinsers, beaters, wringers, hydroextractors, dryers, burr extractors, and finally opening, willowing, and oiling machines.

Wool scouring is not, strictly speaking, a stage in wool manufacture, for it merely puts the fibers into condition to be worked up into yarn. As a rule, it is done in this country in the same mills that manufacture the wool into yarn or cloth. The census of 1921 reports 24 specialized scouring establishments with 1,536 wage earners. Some of these scour wool on contract, whereas others purchase wool.

2. *Carding.*—The second stage common to both the woolen and worsted industries is carding. The preliminary stages leave the fibers

still tangled. The purpose of carding is to open out the fibers so that they lie loosely separated in a uniform film and to eliminate remaining impurities and fibers too short to spin. In woolen manufacture the fiber is usually carded three times; the three cards, known as a set, include the first breaker or scribbler, the second breaker or intermediate, and the finisher card. From the finisher card the material is stripped from the cylinder by two doffers carrying alternate rings of card clothing and smooth leather, the card clothing rings of one working in the line of the smooth leather rings of the other, so that the two doffers together strip the cylinder completely. These doffers in turn are stripped of their ribbons of wool which pass between broad leather aprons which work from side to side with an action like that of the hands and roll each ribbon up into a sliver. These wind up side by side on a jack spool, which then goes to the mule.

3. *Spinning.*—The main characteristics of carded woolens are softness and felting qualities. Woolen yarns, therefore, are typically soft yarns, loosely spun. Most of them are mule spun. On the mule, the drawing and twisting, which are the two main features of the spinning process, are done intermittently in a four-cycle process which is automatic. On the spinning frame, the drawing and twisting processes are continuous, and the product is a harder yarn than is spun on the mule. In woolen mills frame-spun yarn, when employed at all, is used for warp. The frame spinning machines are of various types, but in general they are simpler in construction than the mule, occupy less floor space by nearly one-half, require less skilled labor for tending, and produce more yarn per spindle. Since the frame-spun yarn, however, is not so soft as mule-spun yarn, for all soft fabrics the filling at least, and for most woolen fabrics both warp and filling, must be mule spun. The census of 1925 reported 5,313 woolen frame spindles, as compared with 1,827,058 mule spindles, in the woolen mills of the United States.

Some woolen yarns are doubled and twisted, and some are dyed before weaving. The majority of woolen cloths, however, are woven of single yarns which were spun from stock-dyed material.

4. *Weaving.*—Essentially, cloth consists of two sets of interlaced threads. One set, running lengthwise of the piece, is called warp. If the cloth is perfectly plain, one up and one down, the weaving process consists merely of running each strand of filling or weft alternately over and under each strand of warp. Mounting a loom for such a fabric is simple. The warp yarns are wound on a beam and their ends threaded alternately through two sets of heddles which when put on the loom are made to rise and fall in rotation. In the opening thus made between the raised and the lowered portions of the warp a shuttle containing the filling may be run, and the cloth is woven. But where colors, patterns, or variations in weave are introduced the process becomes more complex, and the work of mounting or dressing a loom so that it will produce a fabric according to design becomes one of the most important parts of the whole process of cloth making.

Standard cloth, which can be produced in enormous runs, is the sort of product best adapted to the type of manufacturing in which American genius has had the greatest success. Therefore, change of fashion, or any other influence which decreases the relative oppor-

unity for big runs on staples, not only increases the cost of weaving but also increases the competitive disadvantages of the standardized American method of cloth making, as compared with the more specialized methods of production of English and continental weavers.

The standard loom, in American woolen mills manufacturing piece-goods, is the 24-harness, 4 by 4 box loom, 82 to 92 inches wide. Some looms are wider, and others have as many as 32 harnesses.

5. *Dyeing.* The greater part of the domestic woolen goods is made from material dyed in the raw stock and therefore spun and woven colored. Some woolens, mainly staples, are piece dyed, but this method is not employed to the same extent as in the worsted industry.

Raw wool may be dyed either in open vessels or in special machines. The open vessels take the form of the wooden vats, some of which are lined with copper; or of copper pans provided with perforated bottoms. With open vessels, water is used to the extent of 30 to 40 times the weight of the wool. When dealing with wools of various grades of fiber which is not uncommon—the dyeing commences with boiling the batch in the coloring matter before adding the acid.

There are many types of dyeing machines in use, all based upon much the same principle, and varying only in detail. With machines the amount of water used is generally from 10 to 20 times the weight of the material that is, about 100 to 200 gallons of water for 100 pounds of wool. When dyeing in machines more attention, however, must be paid to the quality of water employed; if naturally soft water is not available, hard water may be softened by boiling it with a small quantity of oxalic acid (about 5 ounces to 100 gallons).

6. *Finishing.* All classes of fabric change in appearance, feel, and texture in the finishing processes. If, however, there is any particular style of cloth which undergoes a more pronounced change by the application of finishing routine than another, it is an all-wool fabric. Thus the fineness, softness, and firmness of texture, and lustrous surface of a fine doeskin are principally due to the chemical and mechanical treatment to which this class of cloth is subjected in finishing. In "dress-faced" cloths the warp and filling threads, so readily traceable before finishing, are completely covered with pile or nap; that is, with fiber drawn out of the yarns and spread on the surface of the fabric by means of the teazles or card wire of the napping machine. As a woolen cloth is milled or fulled before it is raised, the thready surface which characterizes it on leaving the loom disappears in the felting process, causing the fabric to resemble a felted rather than a woven production. In doeskin, for instance, the fabric in the finished condition possesses but few features in common with the same fabric in the "grey" or "loom" condition. In the finishing operations to which a woolen cloth is subjected, a degree of softness and luster is imparted. Then, again, the bare surface and the thready handle characterizing the fabric in the loom are, after finishing, no longer distinguishable, the former being replaced by a soft velvety nap and the latter by a "clothy" and elastic feel or handle.

There is more latitude for variety of effects in the finishing routine of woolen than in the finishing routine of worsted fabrics. In the latter two features are requisite, namely, a well pronounced and clear weave or color style and a bright surface; these requirements restrict finishing chiefly to one system of operations. It is quite different in

woolen manufacturing. Here the finisher is not restricted to any one definite scheme of work. Variety of surface in the fabrics must be obtained after weaving. By different treatments the cloth may be given a "clear," a "closely felted," a "pile," or a "nap" surface.

In "dress-face" fabrics, for example, such as doeskins, beavers, fine woolen cloakings, and billiard cloths, the surface is covered with a nap of short fibers laid or spread in one uniform direction, that is, lengthwise of the piece. The brightness of the face of the cloths thus treated in finishing is due, primarily, to the combing and straightening of the fibers by the points of the teazles used in raising; and, secondly, to the boiling process, which is repeated alternately with that of raising, until a nap of the requisite density and luster has been developed. On the other hand, in the ordinary classes of woolens, weave and pattern are essential characteristics, so that a finishing routine is utilized which retains the effect of the interlacing of the warp and the filling yarns, and the design produced by the method of grouping the colored threads in the warp, the weft, or both. In fine twills, such as whipcords, Venetians, and buckskins, the object is to obtain a dense, compact texture by practicing a certain degree of felting in combination with a clearly defined weave. The twill effect should be as distinct as in a worsted. By raising and cutting several times alternately this is rendered feasible. "Nap" and "curl" effects form another style of surface produced in woolen cloths by finishing methods.

This brief analysis of the "work" possible on the cloth in woolen manufacturing after it leaves the loom, makes three points evident; (1) that the thread-like structure of the fabric may, in finishing, be obliterated, as in a doeskin; (2) that the weave or plan of construction of the fabric may be made distinct and prominent, as in Venetians and whipcords; and (3) that finishing may develop specific surface characteristics, such as "naps" and "curls."

Fulling.—Milling or fulling, which ordinarily follows scouring, is the initial finishing process that produces a definite change in the woven fabric. The literal meaning of the term to "full" is to augment the cloth in density and compactness in proportion to the amount by which the piece is reduced in width and length. Felting is a quality peculiar to wool fabrics, and does not apply to cloths made of cotton, flax, silk, or other fibers. It is a property peculiar to the physical structure of wool and hair, but chiefly to the former. In a primary sense, the origin of the shrinkage which characterizes a woolen cloth when operated upon in the milling machine is the serrated surface of the wool fiber associated with the elastic, wavy quality of the wool staple; but, in a secondary sense, it is attributable to the mechanical arrangement and combination of the fibers in the construction of a woolen as distinct from a worsted thread. The method of blending and intercrossing the fibers in carding, and also the system of spinning in woolen-yarn manufacture, produce a thread structure which facilitates and expedites felting; whereas the mechanical operations peculiar to worsted-yarn manufacture produce a thread structure adapted to retard and detract from, rather than to assist and add to, the felting quality of the wool; hence a woolen piece mills or felts more satisfactorily and to a larger degree than a worsted piece.

The order of felting as performed in the milling machine is as follows: The piece is first saturated with a soapy solution and then passed between a pair of rollers, the lower roller being flanged and the upper roller—to which regulated pressure may be applied—fitting exactly between the flanges. The squeezing and crushing action on the cloth while in a twisted or rope condition, which here takes place, effects transverse shrinkage or felting in the direction of the weft. On emerging from the rollers the forward passage of the piece is interrupted, and it is cuttled in a narrow and elongated box or trough, the hinged lid of which is weighted, producing shrinkage in the direction of the warp or length of the piece.

The character of the change possible in the condition of a woolen cloth as the result of excessive fulling may be noted as one reason why the system of duties, based on the average yarn number, applicable to cotton cloths in the customs would not be practical on heavily milled woolens. An all-wool texture made of fine yarns, and set 72 inches in the loom, after milling for two days was 40 inches in width and two-thirds of its original length. The surface of the finished cloth had no resemblance to that of a woven texture, the effect of the weave having entirely disappeared, and the fabric resembled a layer of felted wool. So securely had the warp and filling threads been milled together that it was impossible, even with the greatest care, to separate them without breakages. This is obviously an unusually severe change to make in the cloth by milling, yet it serves to illustrate the fact that the greater the fulling the more compact the texture and the higher the breaking strength of the fabric; and that the more it is reduced in length and width, the more perceptibly it is increased in thickness. These, together with the quality of a soft, firm handle, are the main changes in the condition of a woolen piece developed in the fulling process.

Napping.—Whether or not it proves desirable to clear the surface of a woolen cloth of fiber in order to obtain the required finish, the piece after fulling, washing off, and tentering, is raised or napped. The modification which napping produces in the character and appearance of the cloth depends on whether the piece is napped by the damp condition or the dry condition process. The former gets up the loose fibers on the circumference of the yarns, and the latter develops, by repeated treatment, a nap of fibers spread evenly on the surface of the texture. The ordinary napping machine, on which this work is done, consists of a large and rapidly revolving cylinder in the periphery of which are fixed, at regular intervals, a number of frames closely set with teasels, the points of the latter "drafting" or passing through the fibrous surface of the cloth. Wire nappers are also used, but for a cloth on which it is desired to have a fine finish, such as a broadcloth, the old teasel gig or napper is preferable.

Damp or wet raising is adapted to the production of a full, dense nap or fibers such as form the face characteristics of all classes of dress-faced cloths. Dry raising is quite different in principle and in results. Its purpose is to disturb the loose fiber in the texture as a preparation for "shearing." Various classes of fancy woolens are dry napped. Wet napping, by spreading the filaments of the material on the surface of the cloth, prevents, to some degree, the removal of the pile in the shearing operation; this preservation of the nap and length of the fibers causes the fabric to be suitable for a more lustrous finish

and gives it a softer handle than if the piece had been napped dry. Treatment of the cloth in the dry state raises the fiber into that condition in which it is most likely to be removed by shearing. These two standard methods of napping give, therefore, opposite effects—one method concealing the crossing of the warp and weft threads; and the other, by facilitating a clear-cut finish, imparting smartness and precision to both weave and color. The difference is more apparent after the shearing operation; for whereas the only perceptible change effected in the condition of the fabric raised damp is the production of a more even pile, the dry-raised cloth undergoes a complete change. This is developed in shearing, which leaves the surface of the cloth clean and smart, so that weave effects and color combinations are both more pronounced than in the loom.

Boiling.—In woolen finishing, boiling consists in winding the piece tightly and evenly on a wooden roller and boiling in clean water for two or more hours, after which it is taken off and rewound on the roller, commencing with the opposite end of the piece in order that the cloth may be uniformly treated from end to end. This process imparts a permanent luster.

Piece-dyed worsteds are similarly lustered in the operation of "crabbing," in which the pieces are wound onto a perforated roller and "blown" with steam, allowed to set or cool, and then rewound onto a second roller and the "blowing" repeated. Improved brightness and evenness of texture are the result.

Pressing.—Firmness, brightness, and a level, even condition of the piece are acquired in this operation. Hot pressing is necessary to develop satisfactory qualities of texture; cold pressing or "plate" pressing merely implies the placing of the piece under pressure in a regularly cuttled condition. Steaming follows pressing to take off any excessive glaze developed in the operation and to improve the "feel" of the cloth.

After the piece has been pressed and steamed it is given a final examination and any imperfections are indicated and allowed for. It is then measured and rolled up for shipment.

DOMESTIC PRODUCTION OF WOOLENS

A review of the quantity of woven goods produced in the woolen mills in the last few decades is not encouraging to woolen manufacture. It is an industry that is on the decline if the per capita consumption is considered. When the production figures are studied, it will be found that the number of establishments were reduced by more than one-half from 1900 to 1923. With the possible exception of overcoatings and certain types of cloakings, practically all other standard woolens have become somewhat less popular than formerly. Cassimeres, flannels, and other woolen suitings are used in certain grades of men's clothing, but in the long run worsteds "have the call." Woolen dress goods have been largely supplanted by the more expensive and stylish worsteds. Flannels for underwear, which in former times were a considerable part of the woolen production, are now seldom seen. The production of bed blankets—essentially woolen fabrics—has not kept pace with the population, largely because of the advance made in the manufacture of serviceable all-cotton blankets, and the output of horse blankets is smaller because of the automobile.

The value of the total production of the worsted mills first exceeded that of the woolen mills in 1899 and has since continued at a higher figure. The production of woven woolen goods, including blankets but excluding upholstery goods prior to 1923, is recorded by the Bureau of the Census, and from their figures the unit values have been computed, as follows:

Domestic production of woolens, census years, 1909–1925

Census year	Quantity		Value	Unit value	
	Square yards	Pounds		Per square yard	Per pound
1909	215,673,405		$95,239,754	$0.441	
1914	228,562,987		89,683,731	.392	
1919	253,621,026	204,717,071	315,796,118	1.245	$1.542
1921	224,388,113	154,647,577	207,370,346	.924	1.340
1923	316,092,088	226,954,779	321,415,657	1.017	1.416
1925	304,683,747	201,667,313	308,124,413	1.011	1.528

The most striking fact in connection with the woolen and worsted industries brought out by the census of 1889, as compared with that of 1879, was the decline in the market value of the products of the woolen mills. The decline was the result of the change in consumption from the woolen to the worsted fabric. These goods had taken the place of the carded wool cloths, which up to 1860 constituted the entire production of men's wear goods.

The census of 1899 showed a further decline in the total value of woolen products. The decrease amounted to $15,147,819 or 11.3 per cent. There was, however, an increase in quantity of some kinds of goods produced. The decade 1889 to 1899 was a period of falling prices and, therefore, the value was not a good index of production. The production of all-wool cloths—cassimeres, flannels, etc.—for men's wear in 1889 was 25,637,998 square yards, valued at $24,076,808 an average of 93.9 cents per square yard. In 1899 the production of similar goods amounted to 34,551,226 square yards, with a value of $22,860,783, averaging 66.2 cents per square yard. The increase in yardage was nearly sufficient to overcome the decrease in the average value per square yard, and this particular group of goods showed a total decrease from 1889 to 1899 of only $1,216,025. The reduction in average cost per pound of wool consumed, which was 11.5 per cent in woolen mills, accounted to some extent for the reduced value of the production. The popularity at that time (1899) of lightweight woolen suitings for men's wear also accounted somewhat for the increased quantity of goods of that kind manufactured, and also for the greater part of the reduction in the average value per yard. Union or cotton-mixed goods for men's wear showed an increase in both quantity and value; the production in 1889 was 21,042,238 square yards, valued at $12,720,597; and in 1899, 30,767,915 square yards, valued at $13,695,830, The average value per square yard was 60.5 cents in 1889 and 44.5 in 1899. Cotton-warp fabrics, known as cassimeres, doeskins, tweeds, jeans, satinets, etc., for men's wear, decreased from 65,545,016 square yards, valued at $23,460,847 in 1889, to 50,212,178 square yards, valued at $13,897,719 in 1899.

In 1904 fashion temporarily favored woolens. The 1904 census reported an increase in both quantity and value of all-wool, union, and cotton-warp fabrics. The total value of products exceeded that of 1899 by $23,766,500. The production of all-wool woolens amounted to 133,333,339 square yards, valued at $73,196,066; union goods to 63,197,407 square yards, valued at $26,288,407; and cotton-warp woolens to 98,526,697 square yards, valued at $25,905,689.

The census of 1909 reported the total value of products of the woolen mills as $107,118,858, a decrease of $35,077,800 since 1904. All-wool, cotton-warp, and union woolens amounted to 215,673,405 square yards, valued at $95,239,754, a decrease in quantity of 79,384,038 square yards subsequent to the prior census. This decrease occurred in the production of both all-wool and cotton-warp fabrics. The quantity of union goods produced exceeded that of the prior census by 27,153,799 square yards.

The quantity of woolens produced from 1914 to 1921 remained fairly constant; 228,562,987 square yards in 1914; 253,621,026 in 1919; and 224,388,113 in 1921. The public demand for better grade fabrics, in recent years, is shown by the fact that all-wool woolens increased from 74,220,650 square yards in 1914 to 148,015,611 in 1925. The average weight of woven woolen goods decreased from 12.9 ounces per square yard in 1919 to 10.6 in 1925.

The census figures for 1923 show that the production of woven woolens was the largest ever recorded. The value exceeded that of 1919 by $5,619,539 and the quantity by 62,471,062 square yards. All-wool, union, and cotton-warp woolens showed an increase in both quantity and value. Compared with the census figures for 1921, all-wool flannels for underwear increased 60.7 per cent in value and 53.9 per cent in the number of square yards. Cotton-mixed flannels for underwear also showed an increase over the production of 1921, while flannel shirtings showed a decline. In blanket manufacture, the greatest increase over 1921 was shown by the cotton-mixed variety, which increased 105 per cent in value, as compared with 43 per cent for the all-wool and 1.1 per cent for the cotton-warp types.

The census of 1925 recorded the total value of products of 503 woolen mills as $361,524,034, a decline of 0.76 per cent since 1923. Woven goods produced amounted to 304,683,747 square yards, valued at $308,124,413. Compared with the census figures for 1923, all-wool woolens, wool and cotton mixed, cotton warp, and flannels showed a decline. The production of satinets and linseys increased from 6,107,064 square yards, valued at $2,278,151 in 1923 to 11,877,015 square yards, valued at $4,244,228 in 1925.

CHAPTER 3

THE DOMESTIC WORSTED GOODS INDUSTRY

HISTORY

The worsted industry did not develop on a factory basis until after the various combing machines invented in the middle of the nineteenth century had been made commercially available. The most important of these improved combs were the Noble comb, the

type most commonly used in England and in the United States; the Lister or nip comb, best suited to long wools; the Holden or square motion comb; and the Heilmann comb, used on the European Continent more than elsewhere. Before the development of these machines worsted yarns, even when made for factory weaving, had been combed by hand. The combing machines which are now in use were all invented within 11 years, 1842 to 1853. After these combs were introduced the worsted industry grew with great rapidity.

The chief characteristics of the American worsted industry as it is at present constituted are: (1) The relatively large size of plants; (2) the high degree of specialization in process; and (3) the high degree of centralization in a few States and, more specifically, in Lawrence, Mass.; Providence, R. I.; and Philadelphia, Pa. In these three cities the greater part of the country's worsteds are produced.

GEOGRAPHICAL DISTRIBUTION

Massachusetts, Rhode Island, New Jersey, and Pennsylvania are the main producers of worsted goods. In 1919, 862 worsted combs were located in Massachusetts, 385 in Rhode Island, 368 in New Jersey, 343 in Pennsylvania, and 239 in all other States. In 1923, Massachusetts produced 37 per cent in value of the country's worsteds, Rhode Island 21 per cent, Pennsylvania 17 per cent, New Jersey 12 per cent, and all other States 13 per cent.

Of the 338 establishments reported for the worsted-goods industry in 1923, 103 were located in Pennsylvania; 83 in Massachusetts; 69 in Rhode Island; 23 in New Jersey; 16 in New York; 12 in Connecticut; 9 in Maine; 4 in New Hampshire; 4 in Ohio; 3 in Wisconsin, and 1 each in Delaware, Georgia, Illinois, Kentucky, Louisiana, Maryland, Oregon, South Carolina, Texas, Vermont, Virginia, and West Virginia.

ORGANIZATION AND EQUIPMENT

In 1859, there were only three worsted establishments in the United States, capitalized at $3,230,000; in 1919 there were 292 establishments, capitalized at $557,721,000. During this period of 60 years the average number of wage earners grew from 2,378 to 103,830, and the value of products from $3,701,000 to $700,537,000. In 1923, 338 establishments were reported with 122,144 wage earners, and total products valued at $698,270,621. In 1913, 87.8 per cent, and in 1919, 92.8 per cent, of the domestic worsted mills were owned by corporations. In 1923, 156 worsted mills reported individual outputs valued at more than $1,000,000; these 156 establishments produced 46.1 per cent of the total value of products for the entire industry.

The machinery equipment of the worsted goods industry in 1919 and 1925 was as follows:

	1919	1925
Cards, total number	2,457	2,863
Woolen	333	289
Worsted	2,041	2,262
Cotton	83	312
Spindles, total	3,087,916	3,817,174
Woolen	179,536	171,003
Worsted	2,883,132	3,516,388
Cotton	25,248	129,788
Mule spinning	837,312	963,977
Woolen	166,420	154,989
Worsted	670,892	808,988
Cotton		
Frame spinning	1,555,135	2,010,882
Woolen		10,334
Worsted	1,531,551	1,876,048
Cotton	23,584	124,500
Doubling and twisting	695,469	842,315
Woolen	13,116	5,680
Worsted	680,689	831,347
Cotton	1,664	5,288
Looms, total number	45,835	48,251
Power	45,818	48,240
Broad (64 inches or over)	29,281	31,710
Automatic	(1)	11,860
Nonautomatic	(1)	19,850
Medium (50 to 64 inches)	6,422	4,694
Automatic	(1)	3,029
Nonautomatic	(1)	1,665
Narrow (under 50 inches)	10,115	11,836
Automatic	(1)	7,227
Nonautomatic	(1)	4,609
Hand	17	11
Wool-combing machines	2,171	2,557
American manufacture	647	734
Foreign manufacture	1,524	1,823
Braiding machines	250	
Pickers	103	94
Garnett machines	29	21

[1] Figures not available.

The census of 1925 was the first to give the number of automatic looms in the wool manufacturing industry. The following table shows the total number of power looms, and the percentage of those that were automatic in the woolen and worsted industries.

	Power looms	Automatic (per cent)
Woolen-goods industry:		
Total power looms	31,190	20
Broad (64 inches or over)	24,601	21
Medium (50 to 64 inches)	645	41
Narrow (under 50 inches)	5,944	13
Worsted-goods industry:		
Total power looms	48,240	46
Broad (64 inches or over)	31,710	37
Medium (50 to 64 inches)	4,694	65
Narrow (under 50 inches)	11,836	61
Grand total power looms (woolen and worsted)	79,430	36

In 1925, 71 per cent of the worsted combs were of foreign origin. The prevailing width of the worsted cards is 60 inches; these cards are predominantly of domestic manufacture. Very few looms in either the woolen or worsted mills are of foreign origin. Manufacturers in this country consider the looms built in the United States for all varieties of wool fabrics superior to those of any other

nation. Imports of wool-working machinery consist mainly of worsted mules and cap spindles from England, and gill boxes, slubbers, intermediates, and rovers from France.

MATERIALS USED

The raw materials of the worsted industry are wool and other animal fibers and, in semimanufactured form, tops and yarns. The cotton, rags, recovered wool fiber, and waste, recorded by the census as being used in worsted mills, are all used in establishments wherein the products of chief value are worsteds but in which woolen fabrics are also manufactured. All-wool worsteds are necessarily made of "virgin" wool yarns from which the short fibers called "noils" have been removed in the process of combing. Since the invention of the "French" as distinguished from the Bradford system of combing wool, shorter fibers have been used in the manufacture of worsted yarns; however, no system to date has been perfected wherein reworked wool of even the longest staple can be mixed with the raw wool in worsted yarn manufacture. Therefore, any future legislation tending to disclose the amount of wool substitutes used in the manufacture of wool cloths would affect the woolen branch of the industry only. Many fabrics are produced which are a combination of woolen and worsted yarns, or cotton yarns and worsted yarns, but the worsted yarn can be relied upon to contain nothing but "virgin" wool.

Since the census of 1899, the amount of wool consumed in the worsted industry has exceeded that of the woolen branch and the tendency shown in each successive census is for a greater proportion of foreign and a smaller proportion of domestic wool to be used. In 1879, 38.1 per cent of the wool was foreign and in 1919, 46.1 per cent. The largest amount used in any census year was in 1909, when a total of 387,717,415 pounds, in condition purchased, was reached; in 1919, only 337,669,614 pounds were consumed.

The quantity of mohair, camel, alpaca, and vicuna hair used in the worsted industry rose from 6,515,367 pounds in 1909 to 12,474,340 pounds in 1919—an increase of 91.5 per cent. During these 10 years the quantity of cotton used decreased 35 per cent and cotton yarns 29 per cent. The smaller quantity of cotton yarns used in worsted manufacture is reflected in the decreased quantity of cotton-warp goods woven in worsted mills; in 1909, 119,994,875 square yards were produced, and in 1919, 83,826,249 square yards; a decrease in the decade of 23.2 per cent. Tops purchased increased from 20,269,307 pounds in 1909 to 25,732,481 pounds in 1919, or 27 per cent; the quantity of woolen yarns purchased increased 943.6 per cent, but the quantity of worsted yarns purchased decreased 26.8 per cent. In 1909, 211,577 pounds, and in 1919, 331,572 pounds of silk and spun silk yarns were purchased. These yarns are used for decorative purposes in fancy worsteds. The raw materials used in the industry subsequent to the census of 1919 are not recorded.

METHODS OF PRODUCTION

The manufacture of worsteds differs from that of woolens in the introduction of certain processes designed to comb the fibers and lay them straight in the yarn. Woolen fabrics are made to be fulled,

and the aim in all the processes of their manufacture is to produce an open, soft cloth with high felting properties. Worsteds, on the other hand, are fulled only slightly. Their strength and wearing properties depend upon the way in which the fibers are laid in the yarn and not upon the fulling process after the cloth is woven. In finishing worsteds the yarns are clearly defined and not felted. The latter statement is true in general, but must not be interpreted too literally. It is strictly true of the coarse worsteds which are made from long straight wools, with no curly fiber, and with the weave of the cloth clearly outlined. Some of the best worsteds, however, are made of fine wools, with some curly fibers among them, and these not infrequently have high felting properties.

Most fancy woolens and many worsted suitings are more or less fulled to give them strength and body, but the shrinking and felting are comparatively slight. The napping of such cloths is not so severe an operation as in the woolen "faced" cloths. It is carried out in a different way and with a different object. Worsteds are, as a rule, only slightly raised, since their close, firm texture would not allow the rather drastic application of the teasel which some woolens undergo, and the napping of both woolens and worsteds of this type is carried out while the fabric is dry. Its aim is to brush up loose fibers, which are subsequently cut off short by the shearing machine, the net result of the two processes being to show up rather than to conceal the weave.

The chief stages in the manufacture of worsted are successively as follows:

1. Scouring.
2. Carding or preparing.
3. Backwashing.
4. Gilling.
5. Combing.
6. Drawing.
7. Spinning.
8. Weaving.
9. Dyeing.
10. Finishing.

It will be observed that these processes are the same as those used in the manufacture of woolens with the addition of backwashing, gilling, combing, and drawing, which are introduced between carding or preparing and spinning.

1. *Scouring.*—The process of scouring wool intended to be used in worsted yarn is similar in principle and results to that employed on wool for use in the manufacture of woolen yarn.

2. *Carding or preparing.*—The worsted card differs in construction and in combination of parts from a woolen card, but the operation is similar in principle in the two types of machine. The object is to separate, as in woolen carding, the fibers of the wool and to rearrange them, and at the same time to remove burrs and other foreign matter and to deliver the material in one continuous ribbon or sliver of uniform thickness, weight, and fibrous density.

One large card, a combined breaker and finisher, is used. The sliver which comes from the worsted card is not so completely carded as that from the woolen card, but it is not necessary that it should be because of the additional treatment it is to undergo.

While most wools used in the manufacture of worsted yarns are carded, there are some long-stapled varieties in the manufacture of which carding gives place to preparing. Generally, long wools, 7 to 8 inches in length and upward, are prepared for the comb by the preparer; wools below these lengths are prepared for the comb by the carder.

The preparing machine breaks up the naturally formed clusters of material, lays the fibers parallel, and arranges them in the form of a continuous strand. To avoid breakage and to obtain the maximum degree of straightening of the fiber, the process of preparing is usually divided into five or six operations.

3. *Backwashing.*—After carding, the material is ready for those processes which pertain strictly to worsted yarn manufacture, namely, backwashing, combing, drawing, roving, and spinning on the cap frame or flyer frame. Backwashing is the first of these processes. The material, as it leaves the card, may be somewhat discolored by the oil applied to facilitate its passage through the machine, and it may contain some dirty matter. It is necessary before combing to remove such impurities and thoroughly cleanse the material. This is done in the backwashing machine, to which is attached a double-screw gill balling head. The machine consists of a couple of cleansing bowls, each of which contains a pair of immersing rollers and a pair of squeezing rollers, a series of drying cylinders, and the gilling and balling apparatus. A washing or scouring soap, without any excess of alkali, is used in the first bowl, the standard temperature of the scour being 100° to 110° F. After using, it is run to waste, and the solution from the second is conveyed into the first bowl and renewed as required with the scouring ingredients employed. If the sliver should be tinged yellow, a "blueing" or "tinting" solution to whiten the wool is added in the second bowl, which is chiefly utilized for rinsing. From the last drying roller the backwashed material is conveyed to the screw-gill balling head and delivered as two balls of sliver.

4. *Gilling.*—The object of the process is to straighten the fibers, draw out and level the carding, and prepare the material for the combing machine. In the treatment of long wools, it is this process which effects the correct arrangement of the fibers, without other preparatory mechanical operations, in a suitable condition for the comb.

A set of preparing boxes for ordinary combing wools comprises five or six machines similar in construction and also in principle of operation. The sheet or "lap" of fibers resulting from the first gilling is passed through the second box and again delivered in lap form. In the third box a change is made in the mode of delivery. The gilled material is passed through an oval plate and then between a pair of smooth pressure rollers to be delivered in the sliver form into cans. Some six such cans are placed behind the fourth box, and the six slivers drawn out to approximately the thickness of one of the series. A like number is similarly redrafted and reduced in the fifth box and the process repeated in the next or sixth operation. This frequent combination and drawing out of the material is necessary to produce a level and uniform sliver of straightened fibers of suitable composition for the process of combing.

For short-staple wools, such as fine merinos and crossbreds, gilling is practiced both before and after combing. Attached to the backwasher is a gill box capable of delivering the slivers either in four balls or into four cans, and made with two sets of faller screws. Following this leveling treatment the balls of backwashed slivers are passed through a pair of gill boxes, known as preparers or as intermediates because they are used between backwashing and combing.

One such gill box, with one set of screws, is equivalent in output to two Noble combs, each of which, on fine wool, has a productive capacity of 375 to 420 pounds of combed top per day of 10 hours. If the preparers are mounted with two sets of screws and fallers they are capable of supplying material for four combs.

5. *Combing.*—In the combing, drawing, and spinning of worsted yarns there are two separate methods or systems—the English or Bradford system and the French system. The former is employed more commonly in the worsted mills of the United States and England; the latter is the one generally used in continental Europe. In recent years, however, the French system has been introduced into this country, and, although it is to be found in only a comparatively few mills, it is there employed on a large scale. The machinery used in the manufacture of worsted yarns by the French system is practically all foreign.

The purpose of combing is to take out all the short fibers or "noils" and to leave the long fibers all laid parallel and straight in a continuous sliver, perhaps three-quarters of an inch thick, known as "tops." The specialized, separate, top industry is the rule rather than the exception in England and on the Continent. In the United States, however, most worsted mills were established with their own combing departments and still retain them.

6. *Drawing.*—The principle of the drawing operation is that of combining several slivers and drafting them to such a degree as to produce a thick, soft thread which, when twisted, will form a yarn capable of withstanding the tension and friction of the weaving process. Two or more slivers are successively united and drawn to a length equal to the sum of their combined lengths, that is to say, if six strands were put together and elongated into one, a yard of the combined sliver would be attenuated to the length of the six and reduced to a size corresponding to one of the six. This system of equalizing and leveling rectifies any unevenness and further adjusts and straightens the fibers. Six or nine successive machines are employed, all built on a similar principle. Each machine has two pairs of rollers, revolving at different speeds, one pair receiving the slivers and the other delivering them. Draft or attenuation is, in every machine, effected on this sytem. The "ratch" or draft is varied according to the average length of the fibers of the wool, a reduction being made as the material passes from one frame to another, the increase in length of the sliver in each box being in the same ratio as the circumferential speeds of the two pairs of rollers. The Bradford and French systems differ a good deal in the details of these processes. For example, in the Bradford system a twist is imparted to the rovings in the winding, while in the French system this is not done.

Roving may be defined as a combination of drawing and twisting, with an excess of drawing, while spinning is a combination of the same processes with an excess of twisting. It is the last operation through which the slubbing passes before spinning. In the roving box two of the thick slubbings from the preceding machine are combined and reduced in size but increased in length, the operation being the same, with the exception of the twist inserted, as in the drawing machines.

7. *Spinning.*—Woolen yarns, with few exceptions, are produc on the mule, but for worsted yarns there may be used the cap frame, the flyer frame, the ring frame, or the worsted mule, the selection of the type of spinning machine to be used depending mainly on the quality of the wool and the type of yarn to be produced.

In its essentials, ordinary worsted spinning differs but little from the last of the drawing processes. In such spinning there is, however, no doubling and there is a great deal more twisting than at any previous stage. The oldest type of spinning frame, the "flyer" frame, closely resembles the roving machine. Frames are usually made double; that is, they have rows of spindles on each side. The rovings, wound on bobbins, are placed on pegs on the upper part of the frame. Each end passes, as it has so often passed before, between two pairs of drawing rollers, revolving at different speeds. Between the drawing rollers are two pairs of small "carrying" rollers, whose function is merely to conduct the roving to the front rollers. The surfaces of the carriers move rather faster than those of the back rollers. The roving is twisted into yarn between the "nip" of the front rollers and the arm of the flyer, to which it goes direct from the rollers, by the rapid revolution of the flyer; and the spun yarn is wound onto a bobbin running freely on the spindle. The bobbin is made to rise and fall automatically in order to secure accurate winding. Very great speed is impossible in flyer spinning; for, as the flyer is fixed to the spindle some distance from any point where the latter can be supported, high speeds lead to excessive vibration and so are undesirable. The two other types of frames regularly used in worsted spinning are free from this objection. These are the cap and the ring frames. So far as the drawing work is concerned, these frames are identical with that just described; it is the spinning and winding mechanism that differs.

The cap spindle, unlike the flyer spindle, is fixed—a mere peg of metal. The cap, from which the machine takes its name, is also fixed; this is a steel tube, closed at the top, where it receives the head of the spindle, over which it fits. The spindle, just above the point where it is fastened to the rail that carries it, passes through a "whorl," or small, solid horizontal wheel with a grooved edge on which a driving belt works; so that it is the whorl that rotates, not the spindle. To the whorl is attached a brass tube that fits the spindle closely; and the bobbin rests on the whorl. Thus, the bobbin is driven round, not dragged round; and twist is imparted to the yarn between the rollers and the point where it is being wound on the bobbin. A "lifter plate," causing the bobbin to rise and fall, insures accurate winding, just as in flyer spinning. In cap spinning, there is a perpetual rubbing of the yarn against the edge of the cap, around which it is traveling at high speed. Consequently this type of spindle is best adapted to very fine yarns of high-class wool, which can stand the friction and which are required to have a smooth surface. As there is comparatively little friction or vibration in the spindle mechanism itself, cap frames can be driven considerably faster than flyers.

In ring spinning, the spindle rotates and the bobbin with it, for the latter is attached to a plate on the former. The revolving spindle is supported in a long metal "sleeve" and can be driven rapidly with little vibration. On the ring runs the "traveler," a small steel hoop

with a gap that can be squeezed over the flange of the ring; it will then run freely round and round and can only be pulled off with difficulty. The thread passes through the traveler to the bobbin, the motion of which drags the traveler round. Twist is inserted in the roving between the front rollers and the traveler, just as in the flyer frame it is put in between the front rollers and the flyer arm. But whereas on the flyer frame the bobbin is dragged, in the ring frame the bobbin does the dragging. In ring spinning, the accurate winding of the yarn on the bobbin is due, not to any movement in the spindle, but to the rise and fall of the whole ring plate, with its rings and travelers.

The mule, when used for worsted yarn, has on the stationary frame two pairs of fixed rollers between which the sliver is drawn out. The front pair pay out the drawn sliver all the time that the carriage moves, while the spindles are imparting the necessary twist. Mule-spun worsted yarns, though by no means unknown in this country, are not so common here as on the Continent; they are most common in the hosiery yarn trade. It is generally admitted that the combination of the French drawing with mule spinning produces a yarn whose softness and fullness can not easily be attained by any other method; for in mule spinning the friction and drag on the yarn, incidental to flyer, cap, and ring spinning, are very largely avoided.

8. *Weaving.*—The operations through which warp yarns pass between the spinning machine and the loom are the same in principle in the manufacture of practically all classes of textile fabrics, and comprise warping, sizing, and drawing-in.

Weaving, whether considered from an artistic or a mechanical standpoint, is one of the most important operations of textile manufacture. Other operations are secondary, having for their object the preparation of the raw material for the loom, or the improvement in appearance, handle, and surface of the woven product. On the process of weaving depends, to a very considerable extent, the success of manufacture in general. The employment of good, sound, even yarn can not possibly result in satisfactory fabrics if the motions of the loom are in any way defective.

The power loom is constructed to form the shed in the warp according to the required pattern or design; to propel the shuttles in consecutive order across the piece; and to beat the picks of filling into close contact with each other so as to produce a woven fabric, and finally wind it on to the piece beam. The loom usually possesses other minor motions for facilitating quick weaving, such as the arrangements whereby it is brought to a stop without interference on the part of the weaver should the warp or filling yarn be broken, the filling run out, or the shuttle not reach its proper destination.

The weaving of worsted fabrics is similar in all respects to the weaving of woolens. As a rule, the looms used in the worsted mills are somewhat lighter in weight and of less reed space than those used in the weaving of woolens. The standard reed space of a six-quarter worsted loom is 72 inches, whereas for a woolen loom it is generally 82 to 110 inches. Using nonautomatics, two looms to the weaver is the rule for staple worsteds, and not infrequently the practice for fancy worsteds, whereas one loom to the weaver is the rule for woolens.

The automatic bobbin-changing looms are built to produce a wide variety of fabrics with the use of two, four, or six colors or sizes of

filling. This loom will run continuously unless a filling or warp thread breaks, in which event it is automatically stopped by the operation of the filling or warp stop motion. It is better adapted to the weaving of worsteds than of woolens, and is particularly suitable for fabrics made with a cotton warp and a worsted filling. On mixed fabrics of this sort, the cost of weaving is considerably reduced, since one weaver may run six or even more looms. However, on fabrics in which the design calls for a "pick and pick" filling, or a single fancy pick, this loom can not be used, as it is always constructed with a single shuttle box on one end which necessitates the insertion of two consecutive picks from each bobbin.

9. *Dyeing.*—Worsted fabrics are either piece-dyed, cross-dyed, or yarn-dyed. Piece-dyed fabrics are woven with the yarns in their gray or natural state. They are then cleaned and dyed in the piece to such colors as are required.

Cross-dyed fabrics are woven with black or colored cotton warps and with worsted filling in the natural state. After being woven, they are dyed in the piece. The cotton does not take the wool dye, but retains its original color. Mohair, alpaca, and what are known as luster fabrics are generally subjected to this process for the reason that it does not impair the natural brilliancy of the goods as does the cotton-dye bath after the fabric is woven.

Worsted mixtures are slub-dyed. The wool is carded and combed in the natural state and the slubbing dyed and mixed with white or a color before being spun into yarn.

Yarn-dyed fabrics are woven from dyed yarns. Slub-dyed yarns may be distinguished from yarn-dyed yarns by the number of colors in the strand; in the former each individual strand is of two or more colors, whereas in the latter yarn each strand is but one. Dyed yarns are particularly suitable for shepherd checks, fancy checks, and plaids.

10. *Finishing.*—The first finishing process in all fabrics is the examination of the piece with a view to finding imperfections and removing them by hand. Mispicks and threads out in the warp are indicated and sewed in; knots are carefully drawn through to the back of the fabric and clipped off. It is this burling and mending that saves many pieces from being "seconds." The trade is always critical, particularly in times of depression, and will often attempt to return goods only slightly imperfect. In all worsted mills, particular attention is therefore given to the burling and mending departments.

A worsted texture is the same, to a very considerable degree, in appearance and handle after it has been scoured, sheared, and pressed, as it was when it comes from the loom. The chief noticeable alteration that finish effects is a desirable improvement in softness and luster. The point to be specially noted is that while a worsted fabric is only perceptibly changed in thickness or strength during the finishing operations, a woolen fabric, more particularly when milled, increases both in density and fullness of handle, these qualities being obtained more or less in the fulling machine.

Worsted finishing is applied to piece-dyed and to "fancy" fabrics. The routine is similar in the two, but different in that the piece-dyed worsted undergoes finishing treatment both before and after dyeing, and crabbing is more severe than in fancy cloths. Some variation

of routine is also made to correspond with structure and texture. Fulling, for example, may improve the handle of the pieces, particularly if the goods are finely set in the warp and a woolen or single worsted filling yarn has been used. But, bearing in mind that the design must be distinctly developed, either through diversity of weave or coloring, and that the handle and wearing quality of the fabric must be improved, the finishing routine for worsted is not variable to any great degree; it demands only attention to details, even to minutiæ. Briefly, this may be summarized as comprising the operations of burling and mending, scouring, hydroextracting, tentering, crabbing, brushing, shearing, pressing, and steaming.

It will be understood that the routine in any system of finishing is modified to develop the quality and textural characteristics required.

PRODUCTION AND CONSUMPTION

The value of all products of the worsted mills of the United States from 1889 to 1925 is recorded by the Bureau of the Census as follows:

Year	Value	Year	Value
1889	$79,194,652	1919	$700,537,482
1899	120,314,344	1921	524,638,921
1904	165,745,052	1923	698,270,621
1909	312,624,663	1925	596,266,304
1914	275,668,474		

The foregoing figures relate to the total value of output, and as the unit values were different in different years they can not be taken as an indication of the changes in volume of production. It seems clear, however, that there was a steady growth between 1889 and 1909. The total values were somewhat lower in 1914, with wool on the free list; increased to record height in 1919 under the stimulus of the war, although wool was still on the free list; declined sharply in 1921, a year of deflation; and in 1923, with wool dutiable, almost attained the same height as in 1919.

Prior to 1925 the greatest volume of production was actually attained in 1909 and the successive censuses of 1914, 1919, and 1921 showed a trend downward; in 1923 there was a recovery of part of the ground lost. Omitting figures for partially manufactured articles and for by-products and wastes, the production of woven goods by the worsted industry has been recorded by the Bureau of the Census as follows:

Domestic production, of worsteds, 1909–1925

Census year	Square yards	Pounds	Value	Unit value	
				Per square yard	Per pound
1909	355,070,392	----------	$201,207,840	$0.567	----------
1914	336,899,172	----------	178,995,749	.531	----------
1919	282,316,546	124,927,726	423,483,677	1.500	$3.390
1921	269,371,442	116,576,197	343,310,335	1.274	2.945
1923	311,925,421	152,253,135	423,852,012	1.359	2.784
1925	275,105,188	132,637,394	365,444,610	1.328	2.755

The per capita production, which is not materially different from the per capita consumption, of domestic worsteds was 3.92 square yards in 1909 and 2.38 in 1925, or a decrease of 39 per cent. This decrease is due to many causes, but mainly to the increase in costs and prices which has compelled the average consumer to make his wool garments last longer. The following table gives index numbers of retail prices in the United States of domestic wool, worsted weaving yarn, woolen and worsted suitings, and spring and fall suits and overcoats, on the basis of 100 taken as the average of prices in the years 1911, 1912, and 1913.

Index numbers, 1911–1925

[Source: Fairchild Publishing Co.]

Year	Domestic wool	Worsted weaving yarn	Woolen and worsted suitings	Suits		Overcoats
				Spring	Fall	
1911, 1912, 1913	100	100	100	100	100	100
1920	231	336	237	278	302	285
1921	117	176	242	214	218	199
1922	180	203	194	202	193	181

1924	221	225	227	223	224	205
1925	[1] 221	[1] 224	[2] 219	216	222	211

[1] April, 1925.

[2] Spring, 1925, opening.

The postwar prices of wool fabrics have been relatively higher on worsteds than on woolens. Between 1921 and 1925 the production of woolens increased 80,295,634 square yards, whereas worsteds increased only 5,733,746 square yards. With the exception of an increased demand for woolens for use in sport clothing, there has been no noticeable trend in the fashions toward woolens in either men's or women's garments. Clothes made of worsted fabrics are ordinarily sold at higher prices than those made of woolens. When some ready-made worsted suits are retailed as high as $85, it is not surprising that the consumption of worsted cloths has declined.

Prior to 1880 the manufacture of worsteds in this country was confined largely to the making of lightweight goods for women's wear, commonly grouped under the name of "stuffs" or dress goods. An exception to this rule was the manufacture of coarse worsted yarns for use in the carpet industry. Men's-wear worsteds were first manufactured about 1870, and they had so increased in importance by 1890 that the value was nearly double the value of the products of the dress goods mills.

The principal fabrics made in worsted mills are all-wool worsted suitings, overcoatings, and dress goods. Production has remained fairly constant in the last two decades. These fabrics show a decrease from 1909 to 1923 of only 16,412,058 square yards, whereas cotton-warp worsteds show a decrease for the same period of 50,551,348 square yards. This tendency toward fabrics of better grade is manifest in both the woolen and worsted industries, and the superior wearing quality of all-wool cloths is one reason why the per capita consumption of woven fabrics of wool has been less in recent years.

For some years the demand for clothing has been, from the point of view of the trade, anything but satisfactory. Many persons

connected with the industry attribute this directly to the high prices which have existed for clothing. The average of cloth prices for the fall of 1925 is about 141 per cent higher than the average in 1911, 1912, and 1913. This represents a much greater increase over pre-war prices than obtains in most other commodities. The consumption of woolen and worsted goods probably will not show great improvement until prices have dropped sufficiently to stimulate demand.

CHAPTER 4

THE WOOLEN AND WORSTED INDUSTRIES ABROAD

INTERNATIONAL TRADE

For some 10 years or more before 1914 wool manufacturing was expanding. The growth took place both in the countries where the industry was most advanced and in countries where the existence of a domestic wool supply or other favoring influences was stimulating a local manufacture theretofore little developed. Great Britain and the United States were becoming increasingly important manufacturers of wool; Germany and Belgium were rising factors in the trade, and a vigorous Italian industry was beginning to attract international attention; in Japan and Australia new industries were started. In all these countries growth in population was a leading factor in the development of wool manufacture. France alone of the greater powers was lagging behind; among other factors, an almost stationary population of frugal habit hindered expansion in the woolen and worsted industry.

Outside of the larger countries of Europe and the United States small industries were springing up, largely for the weaving of the coarse wool cloths and blankets used by the peasantry. Home-grown wool, which long ago ceased to be the main dependence of the larger wool-manufacturing countries, furnished the wool used by many of these producers. Frequently, these industries began as hand spinning and weaving establishments.

By 1914 the leading wool-consuming countries were more completely equipped for worsted than for woolen manufacture. The basis of the pre-war expansion of the worsted industry appears to have been twofold. In the first place, progression from woolen to worsted manufacture seems to be the usual order of development in wool manufacture. The production of woolen goods is in general a simpler process than worsted making. It involves less handling of the wool preliminary to the spinning stage and demands as a rule less skill both from management and labor.

Expansion went on rapidly in American worsted manufacture from the Civil War down to the close of the nineteenth century, and it became increasingly apparent that the woolen system was to be displaced as the prevailing method. In 1899, worsted first passed woolen output with respect to value. The first decade of the present century witnessed great additions to capacity, and a continuance of the trend away from the woolen system. Apparently, 1909 marked the end of the extremely rapid growth of the industry as a whole, and also of the marked expansion which had been going on for 10 years.

From 1909 to 1914 there was only moderate growth in total wool-manufacturing capacity and a somewhat less pronounced trend toward the worsted system.

The end of the World War found the United States with one-third more worsted than woolen spindles. Allowance must be made for the fact that the outer-wear knitting industry is a consumer of worsted yarns, but this does not invalidate the conclusion that the worsted branch of American wool manufacture has a capacity which can be kept busy only by a very large volume of staple business. Because of a great population of ample means, the wool-manufacturing industry of the United States is more happily situated than that of almost any other country. In 1925, the latest year for which production data are available, domestic manufacturers supplied almost the entire home demand for woolen and worsted goods.

The period of rapid expansion in wool manufacturing in the United States in the first 10 years of the century coincided with a time of progress in the United Kingdom, Germany, and Italy. In France, on the other hand, the woolen and worsted industries were at a standstill. French conservatism delayed the scrapping of worn machinery to give place to models of a more advanced order. Since the war, however, France has been reequipped with the most modern and efficient machinery obtainable, and is now capable of turning out wool goods in as great volume as before the war.

As in the United States and the United Kingdom, worsted manufacture in Germany was developing more rapidly than the woolen industry in the years before the war. By 1907, the German wool industry was heavily equipped for combing and for worsted spinning, in comparison with its woolen equipment. Wool manufacture in Germany profited by relatively low labor charges and longer hours; it was near coal and it was supplemented by an extensive hand-weaving industry. Yet by 1914 it was not thoroughly integrated, and depended on imports to supply its deficiencies in yarn and top production.

Reports from authentic sources show that German textile machinery deteriorated during the war period. The extent of replacement since 1918 can only be surmised. Data are so meager that nothing very certain can be stated as to the actual ratio of woolen to worsted equipment, but it is probable that at present Germany is better prepared to produce worsteds than woolens. The industry has benefited by a broader home market in relation to its production than has France or the United Kingdom and on this score enjoys, with the American industry, a distinct advantage.

Although Italy was beginning to show promise in wool manufacture before the war, it, like Germany, was not self-sufficient in regard to intermediate products, such as tops and yarns. Worsted manufacture was increasing before 1914, but woolen spindleage was still considerably in excess of worsted. In spite of military demand for woolens, in the 10 years between 1913 and 1923 carded wool spindles increased from 521,000 to 550,000 or only 6 per cent, while worsted spindles increased 32 per cent, making the total 500,000 in 1923, as against 378,000 worsted spindles a decade before.

The following table, compiled by the Department of Commerce, shows the machinery equipment of the principal wool manufacturing countries of the world for the latest years for which statistics are available.

Wool manufacturing industries—Machinery equipment

[1] Includes woolens, worsteds, carpets and rugs, felt goods and wool-felt hats.
[2] Figures covering looms and woolen and worsted spindles are 1923 estimates. Other figures are from 1918 statistical report of Bradford Chamber of Commerce, woolen and worsted goods only.
[3] Width not given, figures, therefore, include both wide and narrow looms.
[4] Establishments employing more than 5 persons.
[5] Does not include 10,000 hand looms and 1,400 carpet and rug looms.
[6] Wide—150 centimeters (59 inches) or wider. Narrow—under 150-centimeter width.
[7] Undoubtedly out of date and incorrect to-day, but are the latest figures available.
[8] Includes household establishments.
[9] Width not given; figures, therefore, include both wide and narrow looms but does not include 747 ribbon looms.
[10] Width not given; figures, therefore, includes both wide and narrow looms but does not include 870 carpet looms nor hand looms in the homes.
[11] Wide—170 centimeters (66.9 inches) or over.
[12] Of which 55 manufacture both wool and cotton.
[13] Ranging from 56 to 96 inches in width.
[14] Width chiefly 30-inch.
[15] Seven thousand, five hundred and sixty-one males and 32,661 females.
[16] Woolen and worsted piece-goods mills. There are also 16 wool knit-goods mills, 19 felt and wool cap mills, 135 yarn mills, and 30 scourers and shoddy producers.
[17] Includes employees not only in the 210 woolen and worsted mills but also in the 16 knit goods, 19 felt, etc.

GREAT BRITAIN

ORGANIZATION

In the United Kingdom the organization of wool manufacture is, in many respects, different from that in the United States. In the British worsted industry differentiation of processes is the prevailing form of organization. In the woolen industry the predominant note is, and always has been, that of integration—the concentration of all processes in a single establishment.

Worsteds.—The wool is usually purchased directly from the growers at local British fairs, or indirectly at the Australian and London auctions, by manufacturers, wool merchants, or top makers. If the top maker buys his wool unsorted, either directly at the wool auctions, or from the merchants, it is sorted under his direction; staples of various types and grades are blended and made into tops, usually by the commission combers. It has been estimated that 70 per cent of the tops consumed in the British worsted industry are combed on commission. The combing section of the industry is highly specialized. Some top makers handle only a particular range of tops; for example, crossbreds of certain quality, or Botany types. Similarly, commission combers often confine their operations to particular qualities. With this specialization it is possible to develop great skill in combing and to conduct operations in an efficient manner. Wool scouring is carried on as an integral part of the work of the combers and spinner-combers; it also forms the basis of a separate branch of the industry. Scouring plants confine their operations entirely to scouring and are run on the commission system.

Worsted spinning continues to be predominately a separate and distinct section of the industry. There are certain tendencies toward integration, exemplified by the spinning-combers already mentioned; nevertheless, the spinner who buys his top from the top maker and sells the finished yarn is still the characteristic figure. The spinning of yarns on commission has declined greatly in recent years. The large profits made by commission spinners on Government contracts and the long credits allowed by the Government in the purchase of tops during the war enabled them to accumulate sufficient capital to start for themselves.

An exception to the general system of organization occurs in the spinning of mohair and alpaca yarns. The preliminary process—scouring, carding, and combing—and spinning, are often carried through in the same establishment. The reasons for this variation appear to be partly historical and partly technical. When the utilization of mohair and alpaca on a factory basis was begun, no one knew how to comb the staple, and the early manufacturers of such fibers had to learn for themselves. Consequently, a combination of the two stages of production was adopted. The nature of mohair and alpaca fibers calls, to some extent, for special treatment. The combing machines employed are usually of a different type from those in common use for wool—the Lister instead of the Noble. The length of the staple and its luster, upon which its value largely depends, make necessary special care in preliminary manipulation. The best results can be secured when these processes are under the direct supervision of the person who is also responsible for the spinning.

In the weaving section, as in the spinning section of the industry, there has been a decline, in recent years, in the commission form of operation. The weaver, or "manufacturer," sometimes buys his yarns from the spinner and sells his product "in the grey" to the merchant. He may, however, have it dyed and finished in his own plant or by a commission concern and then sell it to the merchant. In fact, the practice of selling "in the grey" to a merchant who directs the dyeing and finishing himself, to suit his own requirements—a method of operation which has in the past been important—is alleged to have lost favor and now to have become uncommon.

Dyeing is not really an independent branch of the industry like top making, spinning, and weaving, as the work is conducted for the most part on commission for the manufacturer or for the merchant. The dyeing of wool, tops, and yarns, is largely concentrated in the hands of a single corporation, while the dyeing of cloths, which may also include finishing, is largely monopolized by another corporation. Both work on commission. The patrons of such concerns are either manufacturers who have no dyeing departments in their mills, or fabric merchants who buy "in the grey." An increasing proportion of the dyeing is carried on in the weaving mills themselves. Finishing is sometimes carried on independently, although it is often combined with dyeing either in the same plant or under the same management. It is, like dyeing, prosecuted upon the commission system, and it likewise serves manufacturers who lack equipment, or merchants who buy "in the grey."

The worsted industry is so fully differentiated that even the final operation of handling the goods in the manufacturing centers, that of packing for shipment, is often carried on in separate establishments. This work is on a commission basis and is conducted for the convenience of manufacturers and merchants who have no shipping departments or whose facilities are inadequate.

In contradistinction to the whole organization outlined above, is the unmistakable tendency toward integration which can be seen in the English worsted industry. To some extent, this is being brought about by the combination or consolidation of previously distinct, but industrially complementary, firms. A spinner may purchase a combing plant, or a weaver the works of a spinning comber. Such integration has been, in recent years, a not uncommon occurrence in the trade. Other integration has taken place through the extension of plants; for example, the building of a dyehouse by a weaving concern. Still another example is that of the well-known Saltaire Mills, an establishment similar in form to our worsted mills, and containing all the processes from sorting to packing, constructed at one time. Differentiation is still the predominant characteristic of the British worsted industry, but one should not lose sight of the increasing number of integrated and partially integrated concerns, either in single or scattered establishments, in Yorkshire at the present time.

Worsted dress goods are produced largely in the Bradford and Halifax districts, while the manufacture of the finer qualities of men's wear is centered in Huddersfield.

Woolens.—Although woolens are usually manufactured in a single establishment, the dyeing of wool and the dyeing and finishing of fabrics are not always carried on in such plants, but are frequently turned over to the commission firms in that trade. Manufacturers

who require a large variety of colors and shades on their wool, or who have very fine fabrics to finish, make use of the services of commission firms. Also, there are some separate spinning plants, whose product goes to supplement the spinning output of integrated mills, and which is bought by the flannel, hosiery, and carpet trades. Yet, on the whole, in Yorkshire, the west of England, and Scotland, the typical form of organization is integration.

The woolen industry is centered in the West Riding of Yorkshire, with important branches in the west of England and in parts of Scotland and Ireland. The woolen mills of Yorkshire are mainly situated in the Huddersfield, Leeds, Dewsbury, Batley, and Morley districts. The border districts of Scotland are noted for tweeds, fine woolens, and hosiery, and, of late years, the west of England has replaced, to a large extent, its former trade in broadcloths by the manufacture of high-grade uniform cloths and specialties. The Irish mills have a reputation for high-grade tweeds and friezes.

Blankets and flannels are important products of the woolen industry. Their manufacture is centered in the Dewsbury and Rochdale districts, respectively. Blankets are also made at Whitney in Oxfordshire and flannels at Dolgelly and Welshpool, in Wales.

SIZE OF THE INDUSTRY

Among the textile trades of the United Kingdom, the woolen and worsted industry is second only to the cotton industry. In 1913, the woolen and worsted industry contributed to the export trade in the form of tops, yarns, piece goods, and other manufactures of wool, a value of more than £37,000,000. Reliable figures as to the total production of the country are unobtainable. In the Census of Production of 1907 the gross output of that year was placed at a value slightly over £70,000,000, of which about half was exported and half retained for home consumption.

The number of persons employed in the wool manufacturing industry of the United Kingdom, in 1918, including the carpet and shoddy industries, and dyeing and finishing, was 256,400. At that time the war had interfered with the normal operations of the industry and its employees had been reduced in number as far as was consonant with the military needs for wool fabrics. Some addition would have to be made, therefore, to make the figure representative of normal conditions. The number of persons engaged in American wool manufacture was 208,225 in 1919, 201,890 in 1921, and 250,105 in 1923.

In regard to machinery employed, a report on British wool manufacture [2] in 1918, showed a total of 3,061,085 woolen spindles and of 3,466,457 worsted spindles of all types. The corresponding American figures, as given by the war census of 1918, were: Woolen spindles, 2,705,625, and worsted spindles, 2,341,174. In regard to looms, the British industry had, in 1918, approximately 114,000 of all varieties, except carpet and rug looms, while for the same year the war census gave the number in American mills as 80,867. In other words, the British industry had in 1918, 13 per cent more woolen spindles, 50 per cent more worsted spindles, and some 40 per cent more looms than the American industry.

[2] "Report of the departmental committee appointed by the Board of Trade to consider the position of the textile trades after the war," 1918.

EXPORTS

The total exports of woolens and worsteds from the United Kingdom in the years 1913, 1914, 1923, and 1924, were as follows:

Total exports of British woolen and worsted tissues, 1913–1924

[Source: Trade and Navigation of the United Kingdom]

	1913		1914	
	Quantity	Value	Quantity	Value
	Linear yards		*Linear yards*	
Woolen tissues	105, 883, 600	£14, 466, 569	81, 996. 700	£11, 573, 508
Worsted tissues	62, 490, 104	6, 186, 379	70, 304, 400	6, 203, 860
Total	168, 373, 704	20, 652, 948	152, 301, 100	17, 777, 368

	1923		1924	
	Quantity	Value	Quantity	Value
	Square yards		*Square yards*	
Woolen tissues	148, 555, 700	£28, 280, 913	164, 752, 400	£30, 141, 383
Worsted tissues	62, 935, 100	11, 399, 639	56, 832, 200	10, 052, 96 0
Total	211, 490, 800	39, 680, 552	221, 584, 600	40, 194, 343

In 1913 Canada purchased 13 per cent of the total value of the above exports; Germany, 9 per cent; France, 8 per cent; Australia, 8 per cent; Argentina, 7½ per cent; and the United States, 5 per cent. In 1924 Canada took 11 per cent; Germany, 2 per cent; France, 2 per cent; Australia, 7 per cent; Argentina, 6 per cent; and the United States, 9 per cent.

Compared with the British exports of woolen and worsted cloths and dress goods in 1924, amounting at par of exchange to $195,605,770, the United States exported, in the same period, similar fabrics valued at $1,246,789.

A report to Parliament in 1918 showing the position of the textile trades after the war (departmental committee on the textile trades), contains the following statement regarding trade with the United States in woolen and worsted manufactures:

> Our trade with the United States has fluctuated considerably in consequence of tariff changes. In 1890 the exports of woolen and worsted manufactures were valued at £5,148,000. Then came the McKinley tariff, and in 1891 the exports had fallen to £3,178,000. A similar reduction was again experienced in 1897 as a result of the Dingley Tariff Act. During the few years preceding the outbreak of war the exports of piece goods averaged from £1,000,000 to £1,500,000, in spite of the fact that woolen and worsted cloths paid duties varying from 1s. 4½d. per pound and 50 per cent ad valorem to 1s. 10d. per pound and 55 per cent ad valorem.
>
> The effect of the Underwood Tariff Act of 1913, with its modifications of duties, was showing itself in increased shipments when the war broke out, although it should be noted that the removal of the import duty on raw wool entering the United States gave a stimulus to American domestic manufactures. Partly as a result of the new tariff act, and partly, no doubt, as a result, of the war and the cessation of continental competition, the exports in 1914 to the United States advanced to £3,471,482, and, although this total was not maintained in 1915 and 1916, the figures still show a considerable advance on the pre-war shipments.

The following table shows the quantity and value of British woolens, worsteds, and flannels exported to the United States from 1901 to 1925, inclusive:

Exports of woolen and worsted tissues and flannels from the United Kingdom to the United States 1901–1925

[Source: Annual Statement of the Trade of the United Kingdom with Foreign Countries]

Year	Woolen tissues		Worsted tissues		Total woolen and worsted		Flannels

[1] Value converted at par 1901 to 1914, thereafter at average yearly rate.
[2] Up to and including 1919, linear yards; thereafter square yards.

It will be noted that in these British exports to the United States the tendency has been toward an increase in woolens and a decrease in worsteds. In the period just prior to the war and during the war, worsteds exceeded woolens in this trade, but under the tariff act of 1922 woolens predominate. This was mainly due to a demand for fancy backed woolen overcoatings and for woolen suitings made of highly colored mixtures used in sport clothing. The labor cost on fancy backed overcoatings is greater in proportion to the material cost than on single fabrics, because they are woven more slowly. It is on this type of fabric that the foreign producer comes nearest to meeting on the American market the prices quoted by the domestic manufacturer.

IMPORTS

Imports into the United Kingdom of woolen yarns and tissues amounted in value to nearly ten and one-half millions sterling in 1913, or less than one-third the value of the total exports. The imports of piece goods amounted in value to £5,344,000. These were chiefly dress goods for women's wear, produced as a rule with single merino yarns in the warp. Apart from dress goods, imports of woolen and worsted fabrics into the United Kingdom were not very considerable, when compared with the total production of the country. Of cloth

for men's wear, and of the heavier fabrics for women's wear, very little came from abroad.

Imports of woolen and worsted yarns and manufactures amounted to £11,781,081 in 1923 and to £14,869,321 in 1924. Woolen and worsted tissues, flannels, and delaines accounted for £4,711,446 in 1923 and £6,107,254 in 1924.

In recent years the importation of dress goods from France has increased to such an extent that the Bradford worsted industry has applied for a duty of 33⅓ per cent ad valorem on "tissues or fabrics, whether in the piece or any other form, of any weight from 2 ounces a square yard up to and including 11 ounces a square yard, made wholly or partly from wool or hair." The committee of inquiry appointed by the British Board of Trade to inquire into this application for a protective tariff adjourned on December 18, 1925, to consider the evidence in private before making a report to the Board of Trade. The following summary of the hearings may be of interest:

(1) The duty applied for was a 33⅓ per cent ad valorem rate on the above-mentioned fabrics or tissues imported into the United Kingdom.

(2) The applicants for the proposed duty were the Bradford and District Manufacturers' Federation, the Keighley and District Manufacturers' Federation, and the Textile Commission Manufacturers' Association. Opposition was offered by a group committee formed by the textile branch of the London Chamber of Commerce, but the chamber itself was not identified with the action of the committee.

(3) The ancient worsted industry of Yorkshire, the products of which have been known all over the world for centuries and which claimed to give employment to 100,000 workmen, alleged that during the last few years its English domestic market had decreased and foreign fabrics were being offered in the home market at lower prices than those at which it was possible for the Bradford manufacturers to produce them. It was pointed out that in 1920 imports of woolens and worsteds were 10,477,429 square yards, and by 1924 the figures had grown threefold to 29,609,684 square yards. Moreover, the rate of increase in the present year (1925) over 1924 was still more marked, and although the figures were not yet available, it was estimated that the total would prove to be four times the import of 1920. It was not possible to give the precise figure for worsteds alone, owing to the frequent confusion between woolens and worsteds, but the great bulk of the increased imports were lightweight cloths, and were retained for consumption in the United Kingdom. Since 1921 there has been a steadily diminishing number of looms at work, with consequent unemployment, the results entirely of the severity of foreign competition at low prices.

(4) The principal competitors were alleged to be the worsted and light fabric industries of France, which were able to produce goods at lower labor cost by reason of a state of depreciating currency with respect to British exchange.

(5) The applicants for the protective duty engaged not to raise their prices to the English domestic market if foreign competition was eliminated, and urged that their principal motive was to reduce unemployment within the British worsted industry.

The report of the committee of inquiry was issued on April 22, 1926. The committee found that the applicants failed to substantiate a case for the imposition of a duty, as the evidence of unemployment did not support the view that employment in the industry was being seriously affected by the volume of retained foreign imports. The committee recommended, however, that depreciation of foreign currencies, volume of retained imports, and employment in the industry be closely observed, and that if seriously increased unemployment arising from a substantial increase in the volume of retained imports be accompanied by an increase in the bounty obtained by foreign manufacturers as a result of further currency depreciation, a duty computed upon the basis of the rate of 12½ per cent ad valorem be imposed, which it stated would be found sufficient to countervail the export bounty obtained by foreign manufacturers under such conditions.

The following essential decisions were contained in the committee's report:

We find that foreign goods of the class or description to which the application relates are being imported into and retained for consumption in the United Kingdom in abnormal quantities.

The applicants have proved their contention that foreign goods are being sold or offered for sale in the United Kingdom at prices which are below those at which similar goods can be profitably manufactured or produced in the United Kingdom.

We have arrived at the conclusion that unemployment is not at present seriously affected by the importation of foreign competitive goods.

We consider that should importation continue to increase in a volume such as is indicated by the experience of recent years, such importation may exert a seriously adverse effect upon employment in the industry.

We are of the opinion that competition is unfair owing to the depreciation of the French currency operating so as to create an export bounty.

Having regard to the evidence adduced, we are of opinion that the applicants have failed to establish inferior foreign conditions of employment of labor, either as regards remuneration or hours of employment.

We find that competition is unfair only in so far as it arises from depreciation of French currency, which operates so as to create an export bounty in favor of the French manufacturer.

We are of opinion that the applicant industry is being carried on in the United Kingdom with reasonable efficiency and economy.

We are of the opinion that the imposition of a duty on goods of the class or description in question would not exert a seriously adverse effect on employment in any other industry using goods of that description in production.

FRANCE

The requirements of the French woolen industry amount to at least 250,000 metric tons (about 551,150,000 pounds)[3] of wool a year. The number of sheep in France has been falling for many years; in 1913 it was slightly more than 16,000,000 head; in 1919 barely 9,000,000; in 1924 it was estimated at less than 10,000,000. The present home production of wool amounts to 48,500,000 pounds, or approximately two-thirds of the pre-war figure, and as no great improvement is expected the manufacturers have turned to the colonies to make good a part of the deficiency. In Algeria there are 10,000,000 sheep, of which 6,000,000 are clipped and produce about

[3] Report on the Economic and Industrial Conditions in France, 1925, published by Department of Overseas Trade, London.

33,000,000 pounds of wool; Tunis, with 2,000,000 sheep, produces 4,409,000 pounds of wool; and Morocco, with 7,000,000, 22,000,000 pounds. French West Africa, with 2,000,000 sheep, produces 2,205,000 pounds, and in this territory, as well as in Madagascar, the Roubaix-Tourcoing industries are providing for systematic experimental breeding by promoting the introduction of merinos.

Imports of wool into France in 1924 amounted to 491,935,767 pounds, as against 577,430,120 pounds in 1923 and 592,521,744 in 1913. Australia is the most important source of supply, with shipments totaling 208,900,841 pounds in 1924.

It may be safely asserted that the French woolen industry, which since the beginning of 1922 has been extremely active, has never had a more prosperous year than 1924. Imports, both of woolen yarn and of piece goods, declined considerably, while exports of both attained unprecedented volume; exports of woolen fabrics were, in weight greater by 19,841,400 pounds than in 1923, and by 24,250,600 pounds than in 1913. It will be recalled that, during the War, France was deprived of nearly all its working mills (2,000 out of 2,500 combing machines, nearly all of its 2,000,000 spindles, and 39,000 out of 55,000 looms were in the devastated regions) and that the immense woolen imports during the war, and until 1920, which were mainly from England, were due to this fact. The return of Alsace to France increased the woolen and worsted industries of the nation as follows: Worsted combs, 356; worsted spindles, 505,206; woolen spindles, 16,000; and looms, 6,623. The total wool machinery in France in 1925 was approximately as follows: 1,900 combing machines; 2,400,000 worsted yarn spindles; 800,000 woolen yarn spindles; and 55,100 looms.

The following table, which shows the imports and exports of wool yarns and piece goods since 1912, forcibly illustrates the immense advance made since 1919.

French imports and exports of wool yarns and piece goods, 1912–1924

[Source: Economic and Industrial Conditions in France, 1925]

Year	Imports		Exports	
	Yarn	Piece goods	Yarn	Piece goods
	Pounds	*Pounds*	*Pounds*	*Pounds*
1912	2, 522, 062	9, 726, 695	29, 826, 033	46, 675, 791
1913	2, 107, 598	9, 519, 463	32, 720, 673	51, 605, 277

1920	8, 915, 402	23, 393, 011	13, 071, 073	31, 464, 051
1921	1, 373, 466	3, 778, 684	21, 450, 758	34, 325, 622
1922	2, 089, 612	5, 262, 380	27, 299, 562	40, 130, 334
1923	2, 284, 989	3, 130, 532	28, 807, 508	56, 230, 528
1924	1, 671, 087	2, 724, 886	34, 912, 046	75, 994, 767

The exports to Great Britain of French wool piece goods constituted a large trade before the war; in 1912 and 1913, the weights were 14,936,165 and 16,955,579 pounds. In recent years, French exports to Great Britain have been promoted by the depreciation of the franc in relation to sterling. Exports of wool piece goods from

France to Great Britain amounted to 15,392,517 pounds in 1923 and to 20,729,854 pounds in 1924. These were mainly worsted dress goods weighing less than 11 ounces per square yards. Exports to the United States of wool cloths and dress goods were valued at $1,129,013 in 1913; $2,103,759 in 1923; and $2,051,616 in 1924.

French wool goods are distinguished by their variety and originality of design. The trade thrives on the manufacture of fashionable goods and fancy articles. Roubaix-Tourcoing makes fancy and staple goods in both high and low grades; Sedan specializes in fine cloths; Rheims makes cashmeres, merinos, and expensive fashionable novelties. Fine black cloths, both woolen and worsted, are produced at Elbeuf, as well as fashionable goods, riding habits, uniforms and flannels. Carded cloths for ordinary use are manufactured at Vienne and military fabrics at Lodeve and Cleremont. As regards plants and equipment, the industry, with its high proportion of new spindles and looms, is capable of more efficient production than before the war. France now supplies both the home market and foreign markets to a much greater extent than in 1912 or 1913.

GERMANY

The last official report available as to the wool machinery equipment of Germany was made in 1907. At that time the equipment was as follows: 1,721 sets of cards; 2,119 combs; 1,956,342 woolen spindles; 2,236,364 worsted spindles; 578,741 twisting spindles; and 95,841 looms. Approximately one-fourth of the last-named were hand looms. The return of Alsace to France resulted in a loss to Germany of 356 combs; 505,206 worsted spindles; 16,000 woolen spindles; and 6,623 looms.

The wool textile industry in Germany is not centralized but is distributed over the whole country. The situation of the spinning and weaving mills is primarily the result of historical growth; their foundation dates back to the era of household industry. Such considerations as fuel and power supply, accessibility to markets, etc., have played a much smaller rôle.

It is possible to designate several of the more important production areas. (1) The Niederlausitz region, including the southeastern portion of the Mark of Brandenburg and northern Silesia, produces chiefly heavy worsted fabrics, but also a variety of carded woolen textiles. (2) The Saxon-Thuringian district makes a specialty of the finest grades of woolen cloths; goods mixed with silk, and materials for women's suits. In and about Chemnitz various finished goods and upholstery cloths are made. (3) There are an upper Rhenish district and a lower Rhenish region which manufacture fine woolens, women's wear, and imitations of English tweeds, homespuns, and men's heavy suitings. Aix-la-Chapelle is one of the chief centers in this district for fine woolen velours and similar fabrics. (4) There is an important woolen industry at Freiburg in Baden. (5) The Wurttemberg area produces a variety of woolen goods. In addition to these roughly defined districts, there are large woolen mills in a number of north German cities, especially in Bremen, Hamburg, and Berlin.

In Germany, as a rule, a single enterprise is engaged in every stage of manufacturing from the washing of the wool to the finishing and

dyeing of the cloth. Not many establishments are merely spinning mills, although a few firms specialize in worsted yarns and do not go on with the weaving. Worsted weaving mills are almost invariably connected with spinning mills. An increasing number of worsted spinning mills take work on contract from other plants, usually weaving and finishing establishments which purchase the raw wool and supply it to the spinners. There are a good many separate dyeing and finishing establishments, but the work is usually carried on in connection with the weaving mills. Until recently there has been a rather strict differentiation between the spinners making the finer grades of yarn and those manufacturing coarser grades. This distinction tends more and more to be obliterated.

Germany's domestic wool production is entirely insufficient for her needs. In 1922 she imported about 90 per cent of all the raw wool consumed by her spinning mills. The decrease of wool production within the last half century has been striking. At the close of the Franco-Prussian War, the German wool clip was nearly five times as great as it is to-day, while domestic consumption was much less. Imports of raw wool in the calendar years 1923 and 1924 were as follows:

German imports of raw wool, 1923 and 1924

	Quantity		Value	
	1923	1924	1923	1924
Merino wool:	*Pounds*	*Pounds*		
In the grease	192, 873, 399	193, 837, 691	$78, 443, 548	$92, 041, 671
Washed before shearing	4, 333, 582	4, 589, 977	3, 367, 910	4, 366, 921
Washed after shearing	10, 928, 423	12, 476, 272	10, 580, 368	14, 814, 134
Crossbred wool:				
In the grease	71, 667, 640	97, 862, 414	15, 000, 883	30, 378, 122
Washed before shearing	3, 696, 453	2, 773, 607	1, 161, 701	1, 083, 572
Washed after shearing	8, 918, 268	12, 882, 801	3, 253, 574	5, 877, 823

Imports of merino wool are mainly from Australia, Argentina, and British South Africa. Crossbred imports, both before and after the war, have come from a number of sources, of which Argentina is the most important.

Before the war Germany's needs for woolen goods were met largely by domestic production. This was especially true of finished goods, such as cloths, suitings, carpets, men's and women's wear, and upholstery cloths. Her need for finished yarns was less adequately supplied at home, and half-fabricated yarns, i. e., tops, also noils for woolen yarns, were imported to the extent of about 30 per cent of total domestic requirements of the spinners.

Imports of wool fabrics (suitings, etc.) weighing more than 700 grams to the square meter (=20.6 ounces per square yard); press cloths, webbing, sieves for oil pressing and felt cloths for pulp mills, amounted to 132,937 pounds, valued at $248,443, in 1924. Fabrics weighing from 200 to 700 grams to the square meter (=5.9 ounces to 20.6 ounces per square yard), amounted to 2,725,547 pounds, valued at $6,381,854, and fabrics less than 200 grams to the square meter (=less than 5.9 ounces per square yard), amounted to 6,346,602 pounds, valued at $18,946,666, in 1924. Imports were mainly from Alsace-Lorraine, the United Kingdom, Austria, and Belgium.

Exports of woolen suitings and other fabrics (press cloth, felt cloth, etc.) amounted to 28,418,617 pounds, valued at $36,619,201, in 1923, and 22,037,182 pounds, valued at $36,420,304, in 1924. Exports of the above fabrics to the United States increased from 591,274 pounds in 1923 to 1,282,636 pounds in 1924. The largest users of German woolens and worsteds are Austria, the Netherlands, Sweden, Denmark, and Switzerland.

BELGIUM

The output of the Belgian wool manufacturing industry is not in itself sufficient to supply the home consumption of wool fabrics. Belgium produces only about 825,000 pounds (less than 400 tons) of raw wool annually and therefore must import a considerable quantity. Prior to the war Belgian wool imports averaged about 150,000 tons annually, of which fully two-thirds was reexported, leaving approximately 50,000 tons for local consumption. Consumption since the armistice has ranged between 25,600 and 53,900 tons.

The spinning of woolen and worsted yarns is mainly concentrated in and about the city of Verviers. Outside this district there are important woolen and worsted cloth mills at Tournai, St. Nicolas, Eecloo, Loth, Dinant, and Malines. The Belgian wool industry employs about 30,000 hands, of which 16,000 work in Verviers alone. There are in Verviers 12 worsted mills employing 4,000 operatives and 85 woolen plants of various sizes, engaging some 12,000 operatives. The Verviers spinning industry comprises about 355,000 spindles, of which 180,000 belong to the woolen and 175,000 to the worsted branch. The machinery equipment of Belgium has not greatly altered since the war. In 1924 it was estimated to be as follows:

Sets of cards	639
Woolen spindles	339, 705
Worsted combs [1]	340
Worsted spindles	242, 200
Twisting spindles	87, 770
Looms (59 inches or wider)	2, 600
Looms (narrower than 59 inches)	6, 000

The products of Belgian mills include fancy worsted trouserings, overcoatings, whipcords, one-and-one worsteds, tropical worsteds, gabardines, uniform cloths, and various grades of cheviots, serges, and other suitings. Two firms specialize in billiard cloths of 63 to 75 inches in width, weighing 25 to 30 ounces per linear yard; these have sold well in the United States. The total annual production of woolens and worsteds in Belgium is estimated to be about 280,000 pieces, of 40-meter length.

The arrangement of Belgian trade statistics is not such as to give a very clear idea of the foreign trade in woolen and worsted fabrics. In general, however, the Belgian industry has never been able to supply the entire demand at home, and in 1913 the quantity of imports exceeded exports by 25 per cent. The year 1919 was one of replenishing stocks of raw material and finished products, so that imports far exceeded exports. After the prosperity and large exports of 1920 and the depression of 1921 the wool-goods trade in 1922 resumed substantially its pre-war proportions, with imports exceeding exports by about 16 per cent and the figures for total volume in each class not

[1] The worsted combs are chiefly of the Heilmann type.

differing greatly from those of 1913. The principal sources of Belgian imports of woolens and worsteds, before the war and since, have been Great Britain, Germany, and France, in the order named.

Belgium has been largely cut off from French and Spanish markets by high protective tariffs, and the best European fields for Belgian woolen piece goods are Great Britain, the Netherlands, and Switzerland. Of oversea purchasers the most important are Argentina and British India, the latter especially for tropical fabrics. The Netherlands is the largest importer of Belgian shawls, while upholstery cloths find their best markets in Great Britain and the United States.

Although a few of the best known Belgian mills are represented in the United States, most of them have never made a pronounced effort to enter the American market, principally because they are small, conservative in method, and not possessed of adequate means for floating a conspicuous sales campaign. They are obviously not able to compete on a quantity basis, and with rising costs of fuel, freight, and raw materials their advantage on specialties is not great. A Belgian mill, however, will take an order for a few pieces, whereas an American mill requires orders in large quantities. The wide range of fabrics of the usual Belgian mill enables them by this policy to take advantage of momentary demands in various markets.

Belgian fabrics imported into the United States are mainly woolens. General imports of wool cloths and dress goods from Belgium were valued in the United States import statistics as follows:

1913	$617,675
1914	828,355
1922	567,587
1923	161,895
1924	333,339
1925	377,860

ITALY

The wool-manufacturing industry of Italy is centered in the Piedmont district, which possesses about half of the country's looms. Other sections of importance are Venice, Lombardy, and Tuscany.

Italy has a home production of raw wool amounting to about 57,000,000 pounds per annum. Of this quantity, however, about 18,000,000 pounds never reach the mills, but are used for stuffing mattresses and for nonindustrial purposes. The consumption of raw materials by the mills in 1913 and 1924 was as follows:

	1913	1924
	Pounds	*Pounds*
Imports of unwashed wool	28,486,868	68,196,019
Imports of washed wool	11,814,831	10,143,220
Imports of rags, waste, etc.	12,017,691	8,324,977
Total imports	49,299,390	86,664,216
Less exports of raw material	8,738,633	11,396,983
Imports less exports	40,560,755	75,267,233
Plus home production	37,485,000	37,485,000
Net consumption	78,045,755	112,752,233

It should be noted that the above figures exclude imports and exports of tops, which will be dealt with separately. Of the unwashed wool imported, half now comes from Australia and more than a quarter from South America. Italy has no established wool market, purchases of raw wool being made either through the London market or directly from Australia and South America. The direct-purchase system has been facilitated and popularized by the work of the Instituto Commerciale Laniero Italiano, which has its headquarters in Milan with branch offices in Biella and Genoa.

The number of wool-combing machines working in Italy increased from 30 in 1876 to 600 in 1925. This increase in combs naturally led to a corresponding decrease in the importation of tops. In 1922, 10,423,035 pounds were imported and in 1924, 6,005,758 pounds. Italy is now exporting tops on a small but on a very definitely increasing scale. Exports increased from 234,392 pounds in 1922 to 1,315,944 pounds in 1924.

The number of woolen and worsted mills in 1925, large and small, was about 850. If the woolen hosiery factories be included, the total is brought up to nearly 1,000. The machinery equipment in Italy in 1913 and 1925 was as follows:

	1913	1925		1913	1925
Woolen spindles	520,795	600,000	Hand looms	2,000	2,000
Worsted spindles	377,538	520,000	Combing machines	305	600
Power looms	15,000	19,000	Workers employed	56,000	70,000

Italian manufacturers now supply more than nine-tenths of the internal demand for wool goods, and they are continually extending their exportations. Foreign competition is felt mostly in women's materials, French products being somewhat favored because of the tradition of style. The value of wool textiles exported, which before the war was less than a third of the value imported, was actually greater during the fiscal year 1925 than that of imported goods. Recent betterment in the technic of production has rendered the Italian textile more acceptable to the local consumer and has also permitted a relative decrease in cost, with the result that the average consumption per capita during the fiscal year 1925 was about 1 kilo (2.2046 pounds) or slightly more than the pre-war per capita consumption.

Italy's imports and exports of wool textiles were as follows:

Year	Imports		Exports	
	All wool	Wool mixtures	All wool	Wool mixtures
	Pounds	*Pounds*	*Pounds*	*Pounds*
1909–1913, average	7,040,000	(1)	2,970,000	(1)
1921–22	2,662,000	66,000	5,786,000	946,000
1922–23	6,908,000	110,000	5,478,000	2,090,000
1923–24	5,324,000	88,000	11,418,000	2,552,000

[1] Not stated, owing to different tariff classification prior to June 30, 1921.

Imports of such goods are chiefly from England, France, and Germany. Exports go principally to the Balkan States, Yugoslavia, Greece, Egypt, and Turkey. Less important purchasers include Austria, the Dutch East Indies, Argentina, and Chile.

In international competition in the wool industry, Italy is under the handicap of a higher cost of installation of machinery and a higher cost of raw materials imported. On the other hand, Italy profits by the relatively low cost of labor and has the advantage of a considerable supply of home-grown wool. If hydroelectric power is used, the cost is no more than in other countries, but if coal is used in producing power, the cost is much higher than in most wool manufacturing countries. In 1925, the average wage of a girl was about 15 lire per day and of a man about 18 lire. This is, of course, cheap labor according to world standards, but before the war the average wage was 2 lire per day, so that the increase has been considerable. Piecework rates are in force wherever possible.

JAPAN

The wool-manufacturing industry of Japan had its origin in the weaving of army cloth at the Senju Mills in Senju, Tokyo. These were established in 1877 in accordance with the suggestion of Okubo, then the Minister for Home Affairs. Various other mills were built during the wars with China and Russia, so that the total number in 1925 was 42. The Japanese production of mousseline de laine and flannels is more than sufficient for the home consumption, and it is predicted that it will not be long before Japan can supply herself with woolen cloth and serges.

Since the earthquake, financial stringency and depression have characterized Japanese wool manufacture. Many of the smaller plants have not operated owing to lack of capital.

Muslin-making machinery has a yearly capacity of nearly 200,000,000 yards, but the consumption is placed at only 85,000,000 to 100,000,000 yards. Negotiations between officials of the important producing organizations resulted in an agreement in 1924 to restrict output, fix prices, and divert some machinery to cotton weaving.

Imports of wool tops, woolens, and worsteds from Great Britain, during the year 1924, were very heavy, Japan being that country's best customer, but the expiration on March 1, 1925, of the conventional tariff is expected to extend the market possibilities for domestic manufacturers who are expanding their plants in the expectation that better opportunities in the home market will result from the increased import duties.

In Japan, attention is being called to the dependence of the local industry upon foreign countries for raw materials, and the Government is being urged to promote woolgrowing in Hokkaido and Manchuria. It is thought that Japan may attempt in the near future to increase wool production in the territories adapted to sheep raising which are under her control.

Japanese imports of raw wool increased from 11,570,000 pounds in 1913 to 62,060,000 in 1923.

Wool-working machinery damaged by the earthquake has been repaired, and there is more machinery in the country now than before the disaster. The following table shows the different kinds of wool machinery in Japan in 1924.

Wool-working machinery in Japan

Sets of cards	196
Combing machines	368
Woolen spindles	90,960
Worsted spindles	281,456
Looms [1]	11,812

CHAPTER 5

WAGES, HOURS OF LABOR, PRICES, AND COMPETITIVE CONDITIONS

WAGE RATES, HOURS OF LABOR, AND EARNINGS IN UNITED STATES

Wage rates for the several stages of cloth manufacture in the United States are fixed upon various bases. In some occupations, such as wool carding, time rates are employed; in spinning, some mills pay by the hour and others by the pound; in spooling, piece rates are paid according to the number of spools wound; in weaving, practically all mills pay by the linear yard. The rate per yard paid to a weaver varies primarily with the number of picks per inch in the fabric, the speed of the loom, and the number of looms operated. The foregoing are the principal factors affecting the weaving rates, but many smaller factors enter into the computation, such as the number of harnesses, number of colors in the filling, and the kind of filling.

In weaving woolen goods on broad looms a weaver usually attends but one loom. In weaving worsted goods a weaver generally attends two looms, but it often happens, especially where a fine fabric or a fabric difficult to weave is to be made, that he attends only one worsted loom. Automatic looms are used to some extent, principally on staple worsted fabrics, on which a weaver may attend six or more looms.

Earnings per hour, full time and actual hours of work per week, and full time and actual earnings per week for 1924 are presented in the appendix. (See Table 9, p. 117.) These data were compiled by the United States Bureau of Labor Statistics. Summaries are also shown for the years 1910 to 1914, 1916, 1918, 1920, 1922, and 1924. This biennial survey of wages and hours of labor for 1924 was made from pay rolls for periods in January, February, March, April, and May. Schedules were obtained from pay rolls of 72 representative establishments located in nine States.

[1] Ranging from 56 to 96 inches in width.

The following table shows the changes in hours and earnings from 1910 to 1924, using the figures for 1913 as the basis for the index number:

Index numbers of full-time hours per week, earnings per hour, and full-time earnings per week, 1910–1924

[Source: U. S. Bureau of Labor Statistics]

Year	Index numbers of average—			Year	Index numbers of average—		
	Full-time hours per week	Earnings per hour	Full-time weekly earnings		Full-time hours per week	Earnings per hour	Full-time weekly earnings
1910	101	90	91	1916	98	127	124
1911	102	91	92	1918	97	193	186
1912	100	102	102	1920	86	355	304
1913	100	100	100	1922	87	288	251
1914	98	103	100	1924	88	301	263

For the woolen and worsted industries the full-time weekly earnings in 1920 were more than three times the weekly earnings in 1913, but in 1922 there was a drop to about two and one-third times the earnings of 1913. This was caused by a reduction in wages of 22½ per cent, effective in most mills December 20, 1920. On April 30, 1923, a general increase of 12½ per cent was granted, which brought the full-time weekly earnings in 1924 to more than two and one-half times the earnings in 1913.

Changes in wage rates since January 1, 1923, were reported as follows: Of the 72 mills, 49 reported a 12½ per cent increase, 11 reported 10 per cent increase, one mill each reported 20, 12, 11, 9½, and 7½ per cent increases, respectively, and 7 mills reported no change. Overtime work was paid for at an increased rate of 50 per cent by 31 mills, 25 per cent by 9 mills, and 20 per cent by one mill. No increased rate was paid for overtime by 31 mills. Eleven mills reported paying 10 per cent, and one mill 15 per cent, higher wages for night work than for day work. Bonuses were paid by 36 mills to the employees in one or more occupations and were usually based on production. No bonuses were reported by 36 mills.

Average hours and earnings, by States.—The following table shows the number of woolen and worsted establishments, number of employees, average earnings per hour, average full-time hours per week, and average full-time earnings per week, by States, in 1924. It will be noted that the average earnings per hour ranged from $0.468 in New Hampshire to $0.595 in New Jersey.

Average hours and earnings, by States, 1924

[Source: Bulletin of the U. S. Bureau of Labor Statistics, No. 377]

State	Number of establishments	Number of employees	Average full-time hours per week	Average earnings per hour	Average full-time earnings per week
Connecticut	9	1,698	49.0	$0.573	$28.08
Maine	12	2,242	49.5	.565	27.97
Massachusetts	11	16,891	48.0	.533	25.58
New Hampshire	5	3,585	52.8	.468	24.71
New Jersey	4	3,549	48.2	.595	28.68
New York	2	1,528	48.4	.507	24.54
Pennsylvania	18	4,448	51.7	.502	25.95
Rhode Island	9	4,917	48.0	.530	25.44
Vermont	2	2,764	49.5	.567	28.07
Total	72	41,622	49.1	.533	26.17

Wage increases.—Wages are governed largely by the scale in effect in the mills of the American Woolen Co., of Massachusetts. This corporation controls more than 60 mills in the United States. Its total machinery equipment in 1924 was approximately as follows: Woolen cards, 744; worsted cards, 405; combs, 414; woolen spindles, 313,158; worsted spindles, 490,614; twisting spindles, 22,785; broad looms, 10,586; narrow looms, 129. Approximately 40,700 persons were employed.

The following table, based on wage changes made by the American Woolen Co., was published in the October, 1925, Bulletin of the National Association of Wool Manufacturers:

Wages in the United States wool textile industry 1915–1925

Date	Changes in wage levels	Relative wage levels	Index[1] numbers, cost of living	Purchasing power of relative wages[2]
	Per cent			
Dec. 15, 1915		100.0	[3] 102	[3] 98
Jan. 1, 1916	5.9	105.9	108	98
Apr. 17, 1916	10.1	116.6	111	104
Dec. 4, 1916	9.9	128.2	121	106
May 1, 1917	9.2	140.0	130	108
Oct. 8, 1917	9.9	153.9	142	108
Mar. 25, 1918	10.4	169.9	149	114
June 17, 1918	10.0	186.8	164	114
June 2, 1919	18.2	221.0	176	126
Dec. 1, 1919	12.5	248.6	193	129
May 31, 1920	15.0	285.9	196	146
Dec. 20, 1920	[4] 22.5	221.6		
1921			160	138
Apr. 30, 1923	12.5	249.3		
1924			162	154
July 27, 1925	[4] 10.0	224.3	[5] 163	138

[1] Index numbers for cost of living are the average for the period during which each wage level was in force.
[2] The purchasing power of relative wages is the average for each period during which the then current wage level was in effect.
[3] Calendar year.
[4] Decrease.
[5] Estimated for the first 7 months of 1925 and for subsequent months.

A summary of the hourly earnings, full-time weekly earnings, and full-time hours per week from 1910 to 1924, inclusive, of the principal occupational groups in the woolen and worsted industries, is presented in Table 9 of the appendix. (See p. 117.) This table shows that the average full-time earnings per week of male employees in 1924 ranged

from $15.02 for doffers to $42.63 for loom fixers. For females the averages ranged from $15.15 for doffers to $31.98 for weavers. From 1910 to 1920 there was a steady decrease in full-time hours of employment, and from 1920 to 1924 the greater number of hands worked a 48-hour week.

COMPARISON OF AVERAGE EARNINGS OF OPERATIVES IN THE UNITED KINGDOM AND IN THE UNITED STATES

An inquiry by the Ministry of Labor into the average weekly earnings of textile workpeople in Great Britain and northern Ireland shows the following particulars in regard to each of four weeks in 1924, viz, the weeks ended January 19, April 12, July 12, and October 18.

Average earnings of woolen and worsted operatives in the United Kingdom, 1924[1]

Number of workpeople covered [2]	Average earnings in the week ended—				Average in the four weeks
	Jan. 19, 1924	Apr. 12, 1924	July 12, 1924	Oct. 18, 1924	
216,292	$8.60	$9.09	$8.94	$8.94	$8.89

[1] In the above and succeeding table the American currency figures are calculated from the average annual exchange rates as follows: One shilling equal to 24.3 cents in 1913, 19.3 cents in 1921, 22 cents in 1922, 22.8 cents in 1923, and 22 cents in 1924.
[2] Averages of the number employed in the four weeks.

Compared with an average weekly wage of $8.89 in the United Kingdom, the United States Bureau of Labor Statistics reported the average full-time weekly earnings of 41,622 workpeople in 72 woolen and worsted mills in the United States, in 1924, as $26.17 or an excess of 194 per cent over the British wage. In both countries a very high percentage of the employees worked a 48-hour week.

In order to ascertain the relationship of pre-war wages to those prevailing in 1924 in the United Kingdom, the American consulate at Bradford obtained from a large English woolen and worsted mill the data in the appended table.

Average weekly wages of weavers in a typical woolen and worsted mill in the United Kingdom, 1913–1924

Year	Weekly wage	Index number	Year	Weekly wage	Index number
1913	$6.80	100	1923	$12.31	181
1921	8.87	130	1924	10.34	152
1922	11.88	175			

The actual earnings of the mill's employees were averaged upon a weekly basis, for the years stated, from the mill's pay books, which were regularly audited. It may be noted that during the year 1913 the average weekly wage per weaver of woolen and worsted cloths, as paid by this mill on the piecework basis, was $6.80 and reached a maximum in 1923, when it was $12.31 or 81 per cent greater than during the pre-war year mentioned, while during 1924 it was $10.34 or but 52 per cent greater than in 1913.

In the American woolen and worsted mills the average weekly wage [4] for male and female weavers was $12.09 in 1913 and $33.33 in 1924, or an increase of 176 per cent.

PRICES OF DOMESTIC WOOLENS AND WORSTEDS

Woolen and worsted piece-goods prices follow, although usually about a year later, increases and decreases in raw-wool prices. For example, in 1916 both foreign and domestic wools rose in price; in 1917 piece goods showed a corresponding increase. The decline in the price of wool in 1921 was followed by a drop in piece-goods prices in 1922, and the rise in the price of wool during 1923 was reflected in the price of cloth in 1924.

To set forth the price relationship between raw wool and woolens and worsteds, a table has been prepared giving the average prices of 8 foreign and 8 domestic wools, and 41 staple numbers of woolens and worsteds. The grades of wool selected are considered the basic grades of the principal markets of the world, and are the principal ones used in the manufacture of fabrics for men's and women's clothing. The wools selected are as follows:

FOREIGN WOOLS	DOMESTIC WOOLS
Australian 64s–70s.	Fine staple territory.
Superior 12 months Cape.	Ohio de laine.
Australian 60s.	Half-blood territory combing.
Montevideo 60s.	Half-blood Ohio combing.
Australian 56s.	Three-eighths blood territory combing.
Montevideo 56s.	Three-eighths blood Ohio combing.
Australian 50s.	Quarter-blood territory.
Montevideo 50s.	Quarter-blood Ohio combing.

Table 18 in the Appendix (see p. 135) shows the prices of the various grades of domestic wools and the shrinkages figured. Table 19 (p. 135) shows the prices and shrinkages of the foreign wools. The wool quotations have been converted to a scoured basis, and all foreign wools include duties as levied under the various tariff acts.

The cloth prices given in the following table are the average prices of 41 staple domestic woolens and worsteds.[5] In order to obtain a proper comparison, the only kinds of cloth chosen were those of which the constructions have not varied to any appreciable extent since 1911. The prices of these cloths may be taken as indicators of price conditions throughout the 14-year period. Owing to style changes in women's fabrics it has been difficult to get many standard numbers for the 14-year period. It has been possible, however, to find several that have remained standard. The figures for the pre-war years 1911, 1912, and 1913 are consolidated into one simple average. The pre-war average for these three years is used as the base for all price tables.

[4] Bureau of Labor Statistics.
[5] For more complete details, see Table 20 in the appendix, p. 136.

Prices in the United States of foreign and domestic raw wools and domestic woolen and worsted piece goods and index numbers thereof, 1911–1924

Year	Domestic raw wools	Foreign raw wools	Woolens and worsteds	Index numbers			
				Domestic wools	Foreign wools	Wool cloths	Wages [1]
	Per pound	*Per pound*	*Per yard*				
1911, 1912, 1913	$0.5377	$0.6492	$1.2857	100	100	100	100
1914	.5273	.5288	1.1137	98	81	92	108
1915	.6789	.6539	1.1726	126	101	97	----------
1916	.7753	.7973	1.3412	144	123	111	127

1922	.9692	1.1333	2.2459	180	175	186	268
1923	1.1459	1.1824	2.4157	213	182	200	----------
1924	1.1906	1.3174	2.5743	221	206	214	301

[1] Index numbers of average earnings per hour in woolen and worsted goods manufacturing. U. S. Bureau of Labor Statistics, Bulletin No. 377.

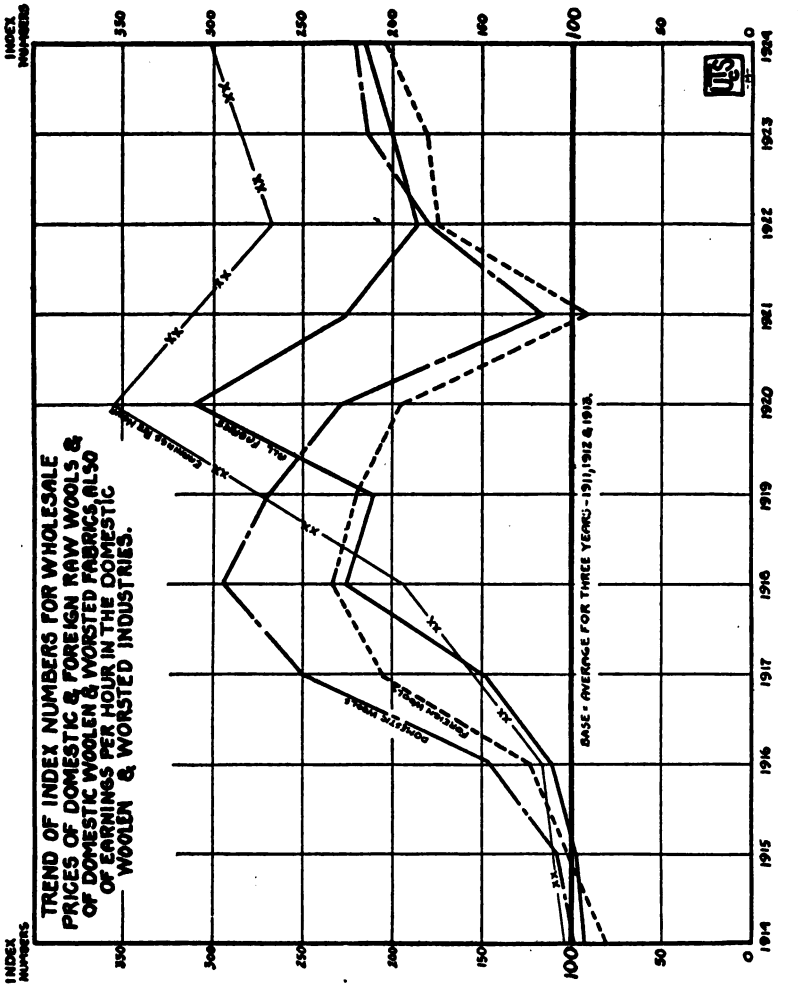
Taking as a base the average price of representative grades of domestic wool in 1911, 1912, and 1913, it will be found that the average price in 1924 was 121 per cent higher than this pre-war average. The average price at which imported wool, duty paid, was sold in Boston in 1924 was only 103 per cent higher than the pre-war average. The average price at which 41 staple fabrics were sold in New York in 1924 was 114 per cent higher than the 1911–1913 average. In the same period the United States Bureau of Labor Statistics records an increase of 201 per cent in the earnings per hour of operatives in the woolen and worsted industries.

The chart on page 55 shows the average wholesale prices, in Boston, of 8 domestic and 8 foreign wools; the average wholesale prices, in New York, of 41 domestic woolen and worsted fabrics; and the earnings per hour of operatives in the woolen and worsted industries of the United States from 1914 to 1924, inclusive.

COMPETITIVE CONDITIONS

Wool manufacturing is one of the most hazardous and precarious of the textile industries. The manufacturer of woolens and worsteds deals with an expensive and peculiar raw material. A greater degree of skill is required in buying wool than in selecting the raw material of any other textile fabric. Its preparation is also more difficult and the finish of its products is much more complicated. The manufacturer suffers constant loss in consequence of minor defects in fabrication. An entire cut of cloth will be thrown back on him in consequence of mispicks, threads out, or other defects due to careless weaving. The perils of the dyeing and finishing rooms are even greater. The dyeing of wool fabrics is, in Europe, a distinct art in itself. Some slight miscalculation in the combination of dyes or acids may weaken or depreciate the fabric and make it a "second." A piece-dyed fabric, perfectly woven and finished, may be slightly shaded from end to end, or side to side, which will cause the whole piece to be returned to the mill.

Manufacturers who market their products through commission houses find an obstacle to success in the prevailing terms of sale. These frequently compel the manufacturer to begin a season's business before he has received payment for goods of the previous season, and abundant capital is an absolute necessity. The accumulation of goods in commission houses, the cancellation of orders for



goods already manufactured or in process, the long credits, the carelessness of operatives, all combine to make conditions under which it is not surprising that many mills fail. It is not necessary to look beyond these conditions to find adequate explanation of the fact that the proportion of failures in the woolen and worsted industries is large. Financial mortality in the past has been high and there are no records to show the number of those who lost their entire capital but paid their obligations and quit. On September 4, 1924, the directors of the largest woolen and worsted manufactur-

ing corporation in the world (an American company) voted to pass the dividend on the common stock because it was unearned; in June, 1927, dividends on the preferred were omitted.

Failures of domestic manufacturers of woolens and worsteds, carpets, and wool knit goods recorded by R. G. Dun & Co. for the last seven years were as follows:

Year	Number	Liabilities	Year	Number	Liabilities
1920	18	$3,170,789	1924	63	$4,883,074
1921	38	1,836,218	1925	70	4,865,828
1922	51	2,890,278	1926	48	3,193,381
1923	42	2,013,042			

The requirements of fashion demand new patterns every season. A large fancy cassimere or fancy worsted mill will produce 500 to 1,000 distinct designs each season, adding greatly to the cost of manufacture. In some mills there are made not less than 50 distinct varieties or classes of fabrics, exclusive of styles. Success in this line of manufacture may therefore be said to depend upon a capacity to understand the popular taste, to anticipate its demands, often capricious, and to adapt the product of the mill to the requirements of the market. It sometimes happens that the entire output of a season is thrown back upon the manufacturer because of some failure of pattern or coloring to conform to the popular whim.

The liability of the American manufacturer to losses of this description is increased by the habit which prevails in the United States of following the trend of European fashions. As a rule, London sets the fashions in men's wear goods and Paris in women's wear goods. The American manufacturer, except the maker of plain and staple fabrics, is usually compelled to follow the styles determined in those cities if he expects to command the home trade. This is always a difficult and sometimes an impossible thing to do under the existing system which compels the styling of fabrics fully a year in advance of the season for which they are intended. The difficulty is increased by the survival of the prejudice, born in the early days of manufacture, in favor of foreign as against homemade woolens and worsteds. This prejudice is disappearing, but it is still a factor which must be recognized.

In England the system of sorting and classifying wools is such that the wool market is amply supplied with all the different sorts and classes. This wide range of choice constitutes an advantage for the English manufacturer. From the want of concentration of wool in our markets, and from other causes, the American manufacturer sorts his own wool and makes goods of various grades in order to utilize the entire fleece. It has followed that there has been less tendency on the part of the domestic mill to confine itself to single specialties. This is more particularly true of the woolen branch of the industry.

The facilities for technical education in wool manufacturing are superior in the manufacturing countries of Europe to those in the United States. Textile schools, supported wholly or in part by the Government, and equipped with the most skillful instructors and with every appliance, exist in Great Britain, Germany, France, Belgium, Austria, Italy, and Czechoslovakia. These schools turn out

annually large number of carefully trained young men who take their place in the factories where they supplement by practical experience the instruction they have received in every department of manufacture. The influence of these technically trained men upon the development of the textile industries of the countries in which they are located has been greater than is realized in this country, where the main dependence for the education of experts is upon the practical schooling received in the mills. Two textile schools in the United States (Lowell and Philadelphia), equipped to teach woolen and worsted manufacturing, have for many years supplied to a limited degree training somewhat similar to that furnished in foreign schools.

The mills abroad possess certain definite advantages growing out of the less mobile character of the operatives. It is common for an English workman in the textile industries to pass his entire working life in one mill at the same class of work. In the United States the factory population is constantly shifting, not only from mill to mill but from town to town and into different occupations; and there is increasing difficulty in obtaining and retaining properly trained help. These conditions naturally affect not only the economies of manufacture but also to a certain extent the quality and character of the products. There are certain lines of high-grade goods in which the American product does not regularly approach the fineness and perfection of finish peculiar to the goods of certain foreign mills, the workers in which have been exclusively employed on those particular lines for many years.

Costs of material are lower in foreign countries than in the United States, the differences in price of wool varying at different times from a half to a whole of the 31 cents a pound duty levied on clean wool. Foreign operatives receive lower wages than in this country, but the relative labor cost per yard or per pound here and abroad varies according to the type of fabric. The labor cost advantage of the foreign manufacturer is greatest in the fabrics carrying the largest percentage of labor, so it is found that the great bulk of our imports consists of fine and fancy goods, as these carry a higher percentage of labor than ordinary staples. Taxes are higher in Great Britain than in the United States, but salaries, interest, mill supplies, fuel, and power are lower. The first cost, for buildings and machinery, is also lower abroad.

The greatest asset of the domestic manufacturer of woolens and worsteds is the possession of a home market with a consuming power greater than that of any other nation. In times of prosperity in the United States the domestic manufacturer is not handicapped by the lack of an export trade, but when the home market is depressed it would be a source of strength if he could sell his fabrics abroad. In England, and to a lesser extent in France, Germany, Belgium, and Italy, the manufacturer of woolens and worsteds is not wholly dependent upon the conditions existing in his own country. His fabrics are sold in the markets of the world and these exports tend to stabilize production.

CHAPTER 6

IMPORTS, EXPORTS, AND RATES OF DUTY

IMPORTS OF WOOLENS AND WORSTEDS

In the period 1860 to 1897, inclusive, the entered value of the imported woolen and worsted fabrics now covered by paragraphs 1108 and 1109 of the tariff act of 1922 seldom went below $20,000,000 per annum. During this 38-year period the annual value of these imports was more often above $30,000,000 than below, and in each of the fiscal years 1866, 1873, 1890, and 1896 the value of these imports was nearly $40,000,000. In the period from 1898 to 1926, inclusive, the annual value of the woolen and worsted fabrics imported into the United States exceeded $20,000,000 only in the fiscal year 1914 and in the calendar years 1923 to 1926 inclusive. The trend of imports during this period is illustrated by the chart on page 59.

The average annual imports for consumption of woolens and worsteds under the operation of the last five tariff acts, and imports in the calendar years 1923, 1924, 1925, and 1926 are found to compare as follows:

Total woolens and worsteds [1]—Imports for consumption—Average per year of 365 days, acts of 1890–1922

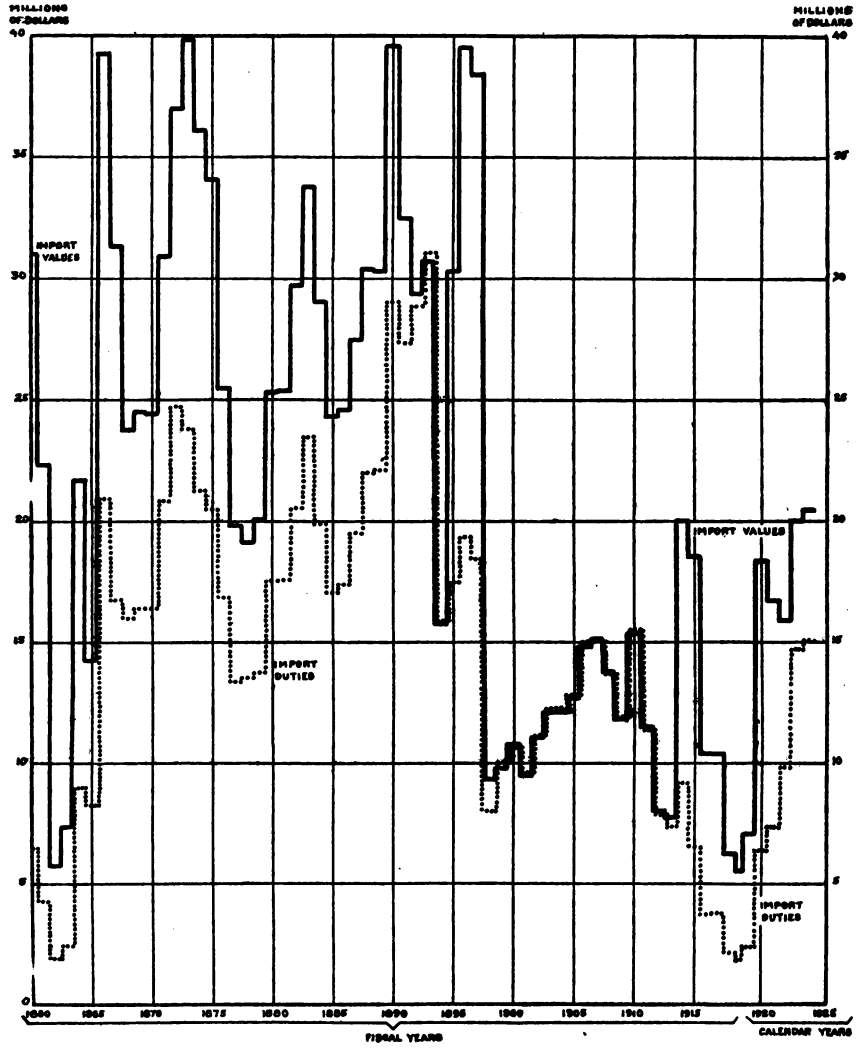
Tariff act of—	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate	Equivalent specific rate
	Pounds				*Per cent*	*Per pound*
1890		$22,719,445	$22,388,735		98.42	
1894		41,841,428	20,136,973		48.71	
1897		11,855,116	11,913,649		100.49	
1909		10,270,832	10,074,826		98.01	
1913	9,736,739	13,723,531	5,363,894	$1,409	39.09	$0.551
1922:						
Calendar year 1923	10,766,496	20,127,887	14,757,796	1.869	73.32	1.371
Calendar year 1924	11,350,314	20,481,672	15,069,683	1.804	73.53	1.327
Calendar year 1925	10,649,145	22,022,680	15,593,083	2.068	70.80	1.464
Calendar year 1926	10,468,151	21,180,044	14,990,238	2.023	71.25	1.442

[1] Total woven fabrics of wool, mohair, etc., such as are now dutiable under paragraphs 1108 and 1109 of the tariff act of 1922.

After the passage of the tariff act of 1913, which removed the duty on raw wool and the compensatory duties on manufactures of wool and imposed a duty of 35 per cent ad valorem on wool cloths and dress goods and 40 per cent on mohair fabrics, it was anticipated that there would be a large increase in the importation of foreign woolens and worsteds. The World War, however, began within seven months of the inauguration of the reduced duties and the abnormal conditions that ensued make it impossible to judge as to what would have been the effect under normal conditions.

Imports of woolens and worsteds were valued at $7,780,872 in the fiscal year 1913 and at $20,093,498 in the fiscal year 1914; the equivalent ad valorem rates of duty were 95.42 and 45.96 per cent, respectively. The act of 1913 became effective on wool and mohair fabrics January 1, 1914. For the last six months under the act of 1909

(July 1 to December 31, 1913), imports were valued at $3,722,158, dutiable at 93.12 per cent; and for the first six months under the act of 1913 they were valued at $16,371,340, dutiable at 35.24 per cent. The decreased rate of duty permitted the entry of goods of the cheaper grades, such as low-grade serges and cotton-warp woolens and worsteds, which had previously not been imported to any extent.



Imports of woolens and worsted—Revenue, 1860–1925

Fabrics weighing over 4 ounces per square yard were valued at $1.17 per pound during the last six months of the act of 1909 (July 1 to December 31, 1913), and at $1.02 per pound for the first six months under the act of 1913; in the fiscal year 1915 similar imports were valued at 93 cents per pound.

The imports entered under paragraphs 1108 and 1109 in the calendar year 1925 were distributed as follows:

Woven fabrics of wool—Import classifications in 1925

Classification	Quantity		Value
Woolens:			
Of wool and other [1] hair—	*Sq. yds.*	*Pounds*	
Not over 4 ounces per square yard	954,462	179,537	$629,676
With warp of cotton	3,536,016	766,696	1,535,296
Over 4 ounces per square yard	14,755,705	8,824,789	17,379,318
Total woolens	19,247,183	9,771,022	19,544,284
Worsteds:			
Of wool and other [1] hair—			
Not over 4 ounces per square yard	80,778	16,974	45,182
With warp of cotton	61,729	15,990	32,052
Over 4 ounces per square yard	1,445,241	734,511	2,153,406
Of mohair—			
Not over 4 ounces per square yard	19,836	4,338	12,482
With warp of cotton	400,317	87,039	193,055
Over 4 ounces per square yard	49,667	19,271	42,219
Total worsteds	2,057,568	878,123	2,478,396
Grand total	21,304,751	10,649,145	22,022,680

[1] Hair, such as alpaca, etc., other than mohair.

Details as to the unit weight, unit value, and relative importance of imports under the above classifications are shown as follows:

Woven fabrics of wool—Details relative to import classifications in 1925

Classification	Average weight per square yard	Average value		Relation to total—		
				Square yards	Pounds	Value
Woolens:						
Of wool and other [1] hair—	*Ounces*	*Per sq. yd.*	*Per pound*	*Per cent*	*Per cent*	*Per cent*
Not over 4 ounces per square yard	3.01	$0.66	$3.51	4.48	1.68	2.86
With warp of cotton	3.47	.43	2.00	16.60	7.20	6.97
Over 4 ounces per square yard	9.57	1.18	1.97	69.26	82.87	78.92
Total woolens	8.12	1.02	2.00	90.34	91.75	88.75
Worsteds:						
Of wool and other [1] hair—						
Not over 4 ounces per square yard	3.36	0.56	2.66	.38	.16	.20
With warp of cotton	4.14	.52	2.00	.29	.15	.14
Over 4 ounces per square yard	8.13	1.49	2.93	6.78	6.90	9.78
Of mohair—						
Not over 4 ounces per square yard	3.50	.63	2.88	.10	.04	.06
With warp of cotton	3.48	.48	2.22	1.88	.82	.88
Over 4 ounces per square yard	6.21	.85	2.19	.23	.18	.19
Total worsteds	6.83	1.20	2.82	9.66	8.25	11.25
Grand total	8.00	1.03	2.07	100.00	100.00	100.00

[1] Hair, such as alpaca, etc., other than mohair.

As the tariff act of 1922 classifies woven fabrics of wool according to weight, tables of imports have been prepared on the weight basis. Table 13 in the appendix (p. 123) shows the total imports of woolens and worsteds from October 6, 1890, to December 31, 1926, including those listed in Table 14, weighing not over four ounces per square yard, and those listed in Table 15, weighing over four ounces per

square yard. These fabrics were classified under former tariff acts as follows: Those weighing not over four ounces per square yard were (a) dress goods, etc., of wool, mohair, alpaca, etc.; (b) dress goods, etc., made with a cotton warp; (c) dress goods, etc., all-wool and cotton-warp; (d) woven fabrics of mohair, alpaca, etc.; and (e) flannels. Those weighing over four ounces per square yard were (a) cloths, woolen or worsted; (b) dress goods of wool, mohair, alpaca, etc.; (c) dress goods made with cotton warp; (d) blankets over three yards in length; and (e) flannels.

Cloths, woolen or worsted.[6]—Cloth is the term usually applied to woven fabrics of wool destined for men's suits and overcoats, and for women's cloaks and sport apparel. Ordinarily, cloths are heavier, firmer, and stronger than dress goods and without the draping quality of the last mentioned. They are of two general classes, (1) woolen, woven of carded yarns, and (2) worsted, woven of combed yarns. Typical woolens are cassimeres, tweeds, cheviots, meltons, kerseys, friezes, mackinaws, and billiard cloths. Typical worsteds are clays, serges, and fancy worsted suitings for men's wear; and light weight serges, poiret twills, and poplins for women's wear.

The tendency, in the last 30 years, has been to decrease the weight of both woolen and worsted cloths. Heavy-weight suitings in former times were made to weigh 18 to 22 ounces whereas in postwar years 12 to 14 ounces per linear yard 56 inches wide are the prevailing weights. Coincidentally, the heavier underclothing of former years has been displaced by lighter weights, summer weights being worn by many throughout the year. The more complete heating of buildings, street and railway cars has brought about a marked change in the clothing habits of the American people, heavier overcoatings, however, offsetting the lighter weight suitings.

Imports of woven fabrics of wool classified in the customs as "cloths" under the last five tariff acts are not comparable. Under the act of 1890 fabrics designated as cloths were only men's wear woolens and worsteds weighing more than 4 ounces per square yard. Under the act of 1894 cloths were considered to be any wool fabric, for either men's or women's wear, not made with a cotton warp. Under the acts of 1897 and 1909, cloths were assumed to be men's wear fabrics only, and did not include dress goods weighing over 4 ounces per square yard, as these were provided for in separate paragraphs. Under the act of 1913 all fabrics weighing more than four ounces per square yard, excluding those made of mohair, were classified as cloths. The tariff act of 1922 classifies woven fabrics of wool according to weight, and as all "cloths" in the prior tariff acts weighed more than 4 ounces per square yard tables have been prepared showing imports classified on the weight basis. These are strictly comparable with fabrics entered under paragraph 1109 of the tariff act of 1922. Table 15 (p. 128), shows the quantity, value, and duty collected on woven fabrics of wool weighing over 4 ounces per square yard, imported from October 6, 1890, to December 31, 1926. This table includes (a) cloths, woolen or worsted; (b) dress goods weighing over 4 ounces per square yard of wool, mohair, alpaca, etc.; (c) dress goods weighing over 4 ounces per square yard made with cotton

[6] In the cotton industry the word "cloth" is used as a general term for all woven fabrics in the piece over twelve inches in width, but in the wool industry it is used in a more restricted sense, in contradistinction to dress goods.

warp; (d) blankets over three yards in length, separately recorded under the tariff acts of 1894, 1897 and 1909; and (e) flannels weighing over 4 ounces per square yard. The average annual imports for consumption of woven fabrics of wool, weighing over 4 ounces per square yard, under the last five tariff acts and imports in the calendar years 1923, 1924, 1925, and 1926 were as follows:

Woven fabrics of wool mohair, etc., weighing over 4 ounces per square yard—Imports for consumption—Average per year of 365 days, acts of 1890–1922

Tariff act of—	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate	Equivalent specific rate
	Pounds				*Per cent*	*Per pound*
1890	15,269,171	$14,264,782	$13,889,796	$0.925	97.33	$0.903
1894	35,155,669	21,655,929	10,423,263	.616	48.13	.296
1897	6,816,062	6,704,457	6,659,553	.984	99.29	.976
1909	6,472,836	6,788,291	6,554,462	1.049	96.49	1.013
1913	6,586,529	9,703,217	3,832,442	1.473	39.50	.582
1922:						
Calendar year 1923	9,911,042	18,510,632	13,634,501	1.868	73.66	1.376
Calendar year 1924	10,297,500	18,429,720	13,642,449	1.790	74.02	1.325
Calendar year 1925	9,578,571	19,574,943	13,985,939	2.044	71.35	1.458
Calendar year 1926	9,461,071	18,974,921	13,606,498	2.006	71.70	1.438

Prior to the fiscal year 1916, woolen and worsted cloths were not separately classified. The export statistics of the United Kingdom, however, show that from 1901 to 1918, inclusive, the quantity of worsteds exported to the United States greatly exceeded that of woolens. From July 1, 1915, to September 21, 1922, wool cloths were classified in American import statistics as woolens and worsteds and each was subdivided into plain and fancy woven. During this period, as shown by the record, the value of woolens was approximately 80 per cent and worsteds only 20 per cent of the total. A study of imports raises some doubt as to the accuracy of these figures.[7] In 1921, for instance, the import records show woolen cloths valued at $10,199,117, and worsted cloths at $2,098,400, or 83 per cent woolens and 17 per cent worsteds, whereas for the same year statistics of the United Kingdom showed exports to the United States of woolens valued at £1,953,314, and worsteds at £1,419,034, or 58 per cent woolens and 42 per cent worsteds. The latter figures are probably more accurate. Woolens and worsteds were again separately classified in 1924; the recorded statistics show that of the total imports under paragraphs 1108 and 1109, approximately one-half of 1 per cent of the value were mohair fabrics, 9.5 per cent worsteds, and 90 per cent woolens. Inquiries made in the trade and at the appraiser's stores in New York disclosed that in reality a much larger percentage of the total value of imports are worsteds.

Imports of wool cloth weighing over 4 ounces per square yard are mainly the finer grades of woolen overcoatings and suitings, fancy worsted suitings, novelty dress goods, and costume cloths. The following data show details of some typical imports under paragraph 1109 in 1924:

[7] The apparent inaccuracy of the previous division between woolens and worsteds appears to have been due to its being based on the wording of the invoices rather than on a careful examination of the fabrics themselves. A large number of the invoices contain the general wording "wool goods" or "wool fabrics," and these appear to have been recorded as woolens although such general terms are applicable to either woolens or worsteds. It is probable that a considerable amount of worsteds were thus statistically recorded as woolens.

Typical imports of wool cloths in 1924

Fabric	Width	Weight per linear yard	Net invoice price	Equivalent ad valorem rate	Source
	Inches	*Ounces*	*Per yard*	*Per cent*	
Melton overcoating	56	35	$3.97½	74	United Kingdom.
Plaid back overcoating	54	31	1.15	112	Do.
Woolen suiting	56	14	1.26	81	Do.
Do	56	15	2.39	68	Do.
Do	56	14	.82	98	Do.
Do	56	15	2.52	67	Do.
Do	56	12	1.15	79	Do.
Tweed	56	17	1.94	74	Do.
Do	56	14	2.60	65	Do.
Do	54	12	.82	92	Do.
Flannel suiting	56	14	2.38	66	Do.
Do	57	12	1.83	68	Do.
Costume cloth	54	17	3.81	62½	Do.
Ladies suede cloth	55	10	.96	78	France.
Plaid back overcoating	56	36	3.56	80	Germany.

An analysis of imports of woven fabrics of wool weighing more than 4 ounces per square yard shows that under acts carrying a compound duty imports were almost wholly confined to those of the highest grade. Imports entered under the lower value classifications were negligible. Under the act of 1890, 98 per cent of the quantity of wool cloths imported were entered under the highest value bracket, i. e., those valued at more than 40 cents per pound. These paid an equivalent ad valorem rate of duty of 97 per cent, as compared with 145 per cent on those valued at from 30 to 40 cents per pound, and 163 per cent on those valued at not more than 30 cents per pound. Approximately 90 per cent of the quantity of wool cloths imported under the tariff acts of 1897 and 1909 were valued at more than 70 cents per pound. These paid an equivalent ad valorem rate of duty of 95 per cent, as compared with 123 per cent on those valued at over 40 cents but not over 70 cents per pound, and 140 per cent on those valued at not over 40 cents per pound. The equivalent ad valorem rates of duty on the various value classifications of paragraph 1109 of the tariff act of 1922 are somewhat more evenly adjusted than under former acts which carried a compound duty. However, imports of wool cloths from September 22, 1922, to December 31, 1926, were largely those of the highest grade; 92 per cent of the quantity were valued at more than 80 cents per pound, 4 per cent were valued at more than 60 cents but not more than 80 cents per pound, and 4 per cent were valued at not over 60 cents per pound. The equivalent ad valorem rate of duty of the latter classifications was 72.10, 101.86, and 84.59 per cent, respectively.

The simple ad valorem rates of 40 and 50 per cent imposed on wool cloths by the act of 1894 permitted the importation of fabrics of the medium and lower grades. Thirty-seven per cent of the cloths imported under this act were valued at not more than 50 cents per pound. The average value of these per pound was 31 cents, as compared with 80 cents for those valued at more than 50 cents per pound. Under the ad valorem duties of 35 per cent on wool fabrics and 40 per cent on mohair cloths, imposed by the act of 1913, the cheaper grades were again imported.

The following table shows the total quantity, average value per pound, per cent of total quantity by value classifications, and equivalent ad valorem rates of duty on cloths imported from October 6, 1890, to December 31, 1926

Imports of cloths, woolen or worsted, by value classifications [1]

	Total quantity	Average value per pound	Per cent of total quantity	Equivalent ad valorem rate
Act of 1890:	*Pounds*			*Per cent*
Valued not over 30 cents per pound	114,742	$0.267	0.25	163.20
Valued over 30 cents, not over 40 cents per pound	965,667	.388	2.15	144.51
Valued over 40 cents per pound	43,817,435	.927	97.59	97.45
Average per year	19,598,281	.913	100.00	97.91
Act of 1894:				
Valued not over 50 cents per pound	23,196,201	.310	37.62	62.00
Valued over 50 cents per pound	56,490,426	.795	62.38	59.00
Average per year	34,970,871	.616	100.00	48.13
Acts of 1897 and 1909:				
Valued not over 40 cents per pound	450,426	.265	.68	148.20
Valued over 40 cents, not over 70 cents per pound	6,966,047	.570	2.79	122.65
Valued over 70 cents per pound	63,749,296	1.105	96.53	94.79
Average per year	4,327,088	1.052	100.00	96.47
Act of 1913	55,638,655	1.465	100.00	[2] 39.69
Average per year	6,374,171	1.465	100.00	39.69
Act of 1922 (Sept. 22, 1922, to Dec. 31, 1926):				
Valued not over 60 cents per pound	1,698,393	.538	4.16	84.59
Valued over 60 cents, not over 80 cents per pound	1,508,273	.713	3.70	101.86
Valued over 80 cents per pound	37,603,558	2.036	92.14	72.10

[1] Includes cloths of mohair, except under act of 1913.
[2] Not straight 35 per cent because of the additional duties imposed by the emergency tariff act.

Dress goods.— Dress goods, in the trade, are fabrics for women's wear, exclusive of the heavier fabrics known as cloakings or costume cloths. Usually both woolen and worsted dress goods are lighter in weight than the corresponding fabrics for men's wear. The fabrics classified in the customs as dress goods under the various tariff acts are of many kinds. Under the acts of 1890, 1897, and 1909, imports so recorded included all fabrics destined for women's and children's wear made of wool, mohair, alpaca, etc., either all wool, union, or cotton warp, and weighing under or over 4 ounces per square yard. Imports classified as dress goods during the period of the act of 1894 were only light-weight fabrics for women's or children's wear, made with cotton warp. Under the act of 1913 all fabrics weighing not more than 4 ounces per square yard were classified in the import statistics as dress goods. These included fine flannels for infant's wear, fine flannel shirtings, and cotton-warp fabrics for men's summer suitings. Italian cloths, specially mentioned in certain tariff acts, are high-grade sateen-woven linings, generally made with a cotton warp and a merino (wool and cotton mixed) filling. Wool bunting is a light-weight, loosely woven fabric intended for flags, decorations, etc., and is usually made of worsted yarns.

The tariff acts of 1890, 1897, and 1909 stipulated that dress goods weighing over 4 ounces per square yard should be dutiable at the

same rate as cloths, except that in the act of 1909 cotton-warp dress goods weighing over 4 ounces per square yard were dutiable at 5 per cent less than the rate provided for cloths. Prior to the act of 1913, imports recorded as dress goods included fabrics made of mohair, alpaca, etc.; after January 1, 1914, these fabrics were separately classified. Imports of fabrics such as tricotines, poiret twills, whipcords, broadcloths, and velours, known in the trade as dress goods, were all classified as cloths during the period of the tariff act of 1913.

Paragraph 1108 of the tariff act of 1922 covers woven fabrics of wool, weighing not over 4 ounces per squard yard. Tables have been prepared showing imports under the last five tariff acts, classified according to weight, which are comparable with imports dutiable under the above paragraph. Table 14, page 124, shows imports for consumption of woven fabrics of wool weighing not over 4 ounces per square yard from October 6, 1890, to December 31, 1926. This table includes (*a*) dress goods of wool, mohair, alpaca, etc.; (*b*) dress goods made with cotton warp; (*c*) dress goods, all wool and cotton warp; (*d*) woven fabrics of mohair and alpaca; and (*e*) flannels weighing not over 4 ounces per square yard. The average annual imports for consumption under the last five tariff acts, and imports in the calendar years 1923, 1924, 1925, and 1926 were as follows:

Woven fabrics of wool, mohair, etc., weighing not over 4 ounces per square yard—Imports for consumption—Average per year of 365 days, acts of 1890–1922

Tariff act of—	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate	Equivalent specific rate
	Pounds				*Per cent*	*Per pound*
1890		$8,454,653	$8,718,962		103.13	
1894		19,685,499	9,713,710		49.34	
1897	[1] 28,582,740	5,150,659	5,263,096	$0.180	102.18	[2] $0.184
1909	[1] 18,576,461	3,486,651	3,520,373	.188	100.97	[2] .190

[1] Square yards. [2] Per square yard.

Wool flannel.—Wool flannel is a light and loosely woven fabric, composed wholly or in chief value of wool, having a certain soft finish, the texture being practically the same as when it leaves the loom. Originally it was, and generally it still is, a woolen rather than a worsted fabric. Recently, worsted yarns spun on the French system have been employed to a limited extent in its manufacture. The varieties of flannel are numerous. The chief categories are flannels for underwear, flannels for shirtings, and flannels for outer garments for both men's and women's wear; and within each category the range of quality is wide.

Flannels for underwear were the only kind mentioned in the tariff laws of 1890, 1894, 1897, and 1909. The special rate, lower than that on cloths and dress goods, applied only to "flannels for underwear." This phraseology was altered in the tariff act of 1913 to read merely "flannel." The tariff act of 1922 makes no mention of flannels, and

imports are dutiable at the rates applicable to other woven fabrics of wool, according to weight.

The old type of flannel for underwear, now seldom made, is the lowest grade and the simplest to manufacture. The white flannel for babies' underwear, which is still produced on a considerable scale, is one of the finest of wool fabrics. There are also coarse, low-grade shirtings; fine, silk-mixture shirtings; a shoddy flannel fabric for outer wear; and fine, white trousering or flannel dress goods competing with the best product of the English industry. It may be stated, however, that as separate classes only flannels for underwear and flannels for shirtings can be identified with any considerable degree of definiteness. A person acquainted with the trade would recognize them readily. The other variety, flannels for outerwear, is not well defined; its delimitations are not clear, especially as to when "a flannel ceases to be a flannel" and becomes a piece of dress goods; the designation of a specific fabric of this type as a flannel would depend largely upon the person inspecting it.

Flannels were among the first woolen fabrics made in this country, and were long an essential product of our wool manufacture. They were generally the coarser qualities for underwear and shirtings. In the pre-war period the yearly output of flannels coming under these heads averaged about 20,000,000 square yards, valued at from $3,500,000 to $4,000,000. In 1919 all-wool and cotton-mixed flannels for underwear, and domet flannels and shirtings, amounted to 30,455,120 square yards, valued at $18,666,292; in 1921 the production fell to 9,000,825 square yards, valued at $4,728,631; and in 1923 the output rose to 12,774,816 square yards, valued at $6,351,096. The cotton-mixed and domet flannels accounted for the entire decline. In addition there was the production of flannels for outer garments which has in later years grown to considerable importance, but for which precise figures are not available.

The domestic production of flannels for underwear and shirtings for which alone figures are available, declined heavily between 1889 and 1899; from 61,195,501 square yards to 20,096,827 square yards, or 67 per cent. The major portion of the decline probably came in underwear flannel. In the decade between 1899 and 1909 the quantity of shirting flannel produced remained practically constant, whereas the quantity of flannel for underwear decreased from 15,541,814 to 10,919,925 square yards, or 30 per cent. The decline in the latter was caused by the invasion of knitted goods and of woven cotton goods into the underwear field previously monopolized by flannels. The causes of this movement are the greater prevalence of well-heated houses, street and railway cars, etc., and the superior fit to be obtained with undergarments made of a knitted fabric. The contrary movement in knit goods is reflected in the statistics of production of knit underwear. For example, between 1899 and 1914 the total quantity produced increased from 16,860,555 dozen garments (shirts, drawers, and union suits) to 28,031,290 dozen, or by 66 per cent; in 1923, 23,492,510 dozen garments were produced. The proportion of cotton goods in this production increased from 76 per cent in 1899 to 89 per cent in 1923. During the period 1899 to 1923 the production of flannels for underwear fell 57 per cent.

The following table, based on the census figures for 1923, shows the average weight and value of flannels for underwear, all-wool and cotton-mixed, and domet flannels and shirtings.

Wool flannel	Weight per square yard	Value	
		Per square yard	Per pound
Flannels for underwear:	*Ounces*		
All wool	7.804	$0.745	$1.528
Cotton mixed	4.869	.433	1.422
Domet flannels and shirtings	7.423	.421	.908

Imports of "flannels for underwear" under the tariffs of 1897 and 1909 were very small as compared with the domestic production. The average annual value of flannels, of the type brought in during the years 1905 to 1909, was considerably less than 3 per cent of the value of the domestic production in 1909. The quantity brought in during the succeeding years, 1910–1913, averaged in value 5½ per cent of the domestic output of underwear flannels in 1914. The increase in percentage was in part due to an increase in imports and in part to a decrease in domestic production. The inclusion in the import figures, after 1913, of types of flannel other than for underwear makes impossible similar comparisons for 1919. The imports of all types in that year amounted in value to somewhat less than seven-tenths of 1 per cent of the 1919 production, while for the period 1915–1921 they averaged slightly less than 2 per cent of the 1919 production.

Another feature of the import trade under the acts of 1897 and 1909 was the rate of duty imposed by the tariff on flannels of medium and low grade. Of those valued at less than 50 cents per pound, the importations did not exceed a hundred pounds, or a few hundred square yards. Somewhat greater quantities came in at 50 to 70 cents per pound; but by far the largest proportion of the imports was entered at the highest classification—valued at over 70 cents per pound. The equivalent ad valorem rates paid by the latter, weighing over 4 ounces per square yard, averaged 104 per cent. On a few of the classes that did not come in to any extent the rates reached 143 per cent.

It should be noted that the value per unit of flannels for which imports were considerable compared very favorably with the value of the dress goods imported. In the years 1910–1913 imported dress goods weighing less than 4 ounces per square yard averaged 18.75 cents per square yard, and dress goods weighing over 4 ounces per square yard averaged 91.7 cents per pound. The bulk of the flannels imported, as stated above, were valued at over 70 cents per pound. On this basis it would seem certain that only superior qualities of underwear flannels were imported. It is worthy of note that the importation of flannels of the higher qualities, of which our purchases abroad had until then almost entirely consisted, showed no such extraordinary increase after the imposition of the lower duties in 1914 as did the imports of most wool manufactures, especially when it is borne in mind that the scope of the flannel paragraph in the act of 1913 was greatly extended by a change in phraseology,

i. e., to include all flannels. . Imports of flannels valued at over 50 cents per pound increased, despite the broadening of the basis, from an average of approximately $109,000 for 1910–1913 to only $144,219 in 1914; whereas cloths increased from an average of $5,164,287 for 1910–1913 to $12,023,807 in 1914.

A marked increase in imports of the cheaper qualities of flannels, however, did take place. Under the previous tariffs, as above noted, the importations had been negligible, but in the latter half of the fiscal year 1914 over 50,000 pounds were brought in. These were probably shoddy flannels for underwear and shirtings, attracted by the comparatively low rate of duty (25 per cent ad valorem).

In the calendar year 1920 imports of wool flannels amounted to 337,692 pounds, valued at $780,820. Of this import only 2,975 pounds were valued at less than 50 cents per pound. Following the enactment of the emergency tariff law on May 27, 1921—which levied a duty of 45 cents per pound, in addition to the rates under the act of 1913, on all manufactures of wool—imports of flannels fell off sharply, and judging from the marked increase in value per pound were confined to the highest grades. Thus, during the period January 1 to May 27, 1921, inclusive, imports of flannels amounted to 370,575 pounds, with an average unit value of $1.54, whereas for the remainder of the calendar year they amounted to only 107,470 pounds but had an average value of $2.19 per pound. From January 1 to September 22, 1922, imports included only 296 pounds valued at less than 50 cents per pound, but 220,145 pounds, valued at more than 50 cents per pound; the average value per unit of the total, including both classes, was $1.99.

In the tariffs prior to 1922 lower duties were imposed on flannels than on cloths and dress goods, on the theory that flannels are essential to one's warmth during the day as blankets are at night; that they were in universal use as articles of comfort and necessity and so were particularly entitled to lower duties.

The omission of the word "flannel" from the tariff act of 1922 stops litigation as to what is or is not "flannel" and permits such goods to enter on a parity with other woven fabrics of wool under paragraph 1108 or 1109, according to weight. Imports of flannels weighing not over 4 ounces per square yard, entered under the tariff acts of 1890, 1894, 1897, and 1909, will be found in Table 14e, page 127. Flannels weighing over 4 ounces per square yard, imported from October 6, 1890, to September 22, 1922, will be found in Table 15c, page 131.

Fabrics of mohair, alpaca, etc.—Mohair is the long, silky hair of the Angora goat, native to the mountainous interior of Asia Minor. The center of the district is Angora, now the capital of Turkey, about 220 miles from Constantinople.

Until recent times almost the entire supply of mohair was obtained from Constantinople. For some time all attempts to acclimatize the Angora goat elsewhere proved unsuccessful. When the goat was removed from its native mountains, its fiber deteriorated and lost its distinctive features. Mohair production is now, however, successful in South Africa, Australia, and the United States. The best mohair still comes from Constantinople and is called Turkey mohair, though by far the largest quantity imported into the United States comes from South Africa.

The mohair fiber is soft, silky, white, and lustrous; 12 months' growth is from 6 to 12 inches in length. The mohair from the southwestern part of the United States is usually shorter, as the goats are sheared twice a year. If this is not done, the goats shed their hair because of the warm climate. The average weight of an Angora fleece is about three pounds—much less than the average weight of the fleece of a sheep.

Although American imports of mohair originate almost entirely in South Africa and Turkey, a considerable proportion comes by way of England and in import statistics is credited to that country.

Imports for consumption of "hair of the Angora goat, alpaca, and other like animals" averaged, per year of 365 days, 1,953,007 pounds under the act of 1909 and 6,061,939 pounds under the act of 1913. The bulk of these imports consisted of hair of the Angora goat; that is, mohair, but this item was not listed separately prior to the act of 1922. In the calendar year 1925 imports of mohair amounted to 1,783,994 pounds in the condition imported, with equivalent clean content of 1,329,952 pounds. The domestic production of mohair in 1925 is estimated to have been about 10,661,000 pounds. Domestic mohair is stated, by manufacturers, to be inferior in luster and in spinning qualities to the Turkey mohair but to have been improved in length and in quality during recent years.

Mohair fabrics are usually made with a cotton warp. Imports dutiable under paragraphs 1108 and 1109 are mainly coat linings, but also include dress goods, summer suitings, and automobile-top fabrics. (For information as to plush, the main fabric made of mohair, see Part 2, Pile fabrics.)

Hair of alpaca, llama, and vicuna.—Alpaca fiber is grown on the animal of that name. It is superior to mohair in strength, flexibility, and fineness of texture. The fiber is 10 to 16 inches in length. The reddish-brown hair is more valuable than the white hair. Production is limited exclusively to the Andean highlands of Peru, Bolivia, and Chili. Arquipa, the center of activity in the alpaca market, is located on the southern railway of Peru at an altitude of about 8,000 feet.

The alpaca, although closely related to the llama, with which it interbreeds freely, differs from it in bodily structure and in the character of its fleece. The alpaca is smaller than the llama, rarely attaining a height of 3 feet, its limbs are more slender, and its neck longer. It is customary to shear the alpaca every second year, but it has been found that the fiber continues to grow for a longer period, and that it would probably be profitable to shear only every third year. The present yield averages about 10 to 15 pounds per animal every second year.

Vicuna is a fine soft fiber, reddish brown in color; it resembles alpaca but is shorter and softer. Llama hair also resembles alpaca but is coarse and short. The uses of these hairs are similar to the uses of mohair. The average annual importation of alpaca is about 1,000,000 pounds; very little llama or vicuna finds its way to this country.

Woven fabrics made in chief value of mohair, alpaca, etc., were first separately classified under the tariff act of 1913 when they were made dutiable at a higher rate than similar fabrics made of wool. Under the act of 1913 wool was entered free of duty, but the hair of

the Angora goat, alpaca, and other like animals was dutiable at 15 per cent ad valorem, tops made thereof at 20 per cent, yarns at 25 per cent, and woven fabrics at 40 per cent. Under all other tariff acts these fibers and manufactures thereof were dutiable at the rates levied on wool and wool manufactures.

The average annual imports under the act of 1913 of fabrics made of mohair, alpaca, llama, and vicuna, amounted to 697,727 pounds, valued at $1,015,602. The unit weight of these fabrics was not recorded in import statistics, but they are known to have been mainly lightweight linings made with cotton warp, and to have been mainly of English origin. As shown in Table 14d, page 127, imports of woven fabrics of mohair, alpaca, llama, and vicuna, were not recorded prior to the act of 1913. The unit value was $1.456 per pound; the equivalent ad valorem rate of duty was 42.62 per cent. The years of largest importation were 1915 and 1916, with 1,198,319 and 1,136,602 pounds, respectively; 1919, with only 152,835 pounds, was the year of the smallest importation.

Under the act of 1922 imports of fabrics wholly or in chief value of mohair are separately recorded but imports of fabrics of alpaca, llama, and vicuna are included, without separate mention, with imports of fabrics made of wool. Because of this change in statistical tabulation it is not possible to compare imports of the above-mentioned fabrics under the acts of 1913 and 1922. As shown in Table 14d, imports in 1925 of fabrics wholly or in chief value of mohair amounted to 91,377 pounds, valued at $205,537. The unit value was $2.25 per pound; the equivalent ad valorem rate of duty was 66.19 per cent.

The mohair and alpaca linings made in Great Britain are preferred by some domestic manufacturers and tailors of high-grade clothing. In these fabrics the element of style is almost wholly lacking and sales must therefore depend upon quality and finish. Imports under the act of 1922 are almost entirely of the better grades.

COMPARISON OF IMPORTS WITH DOMESTIC PRODUCTION

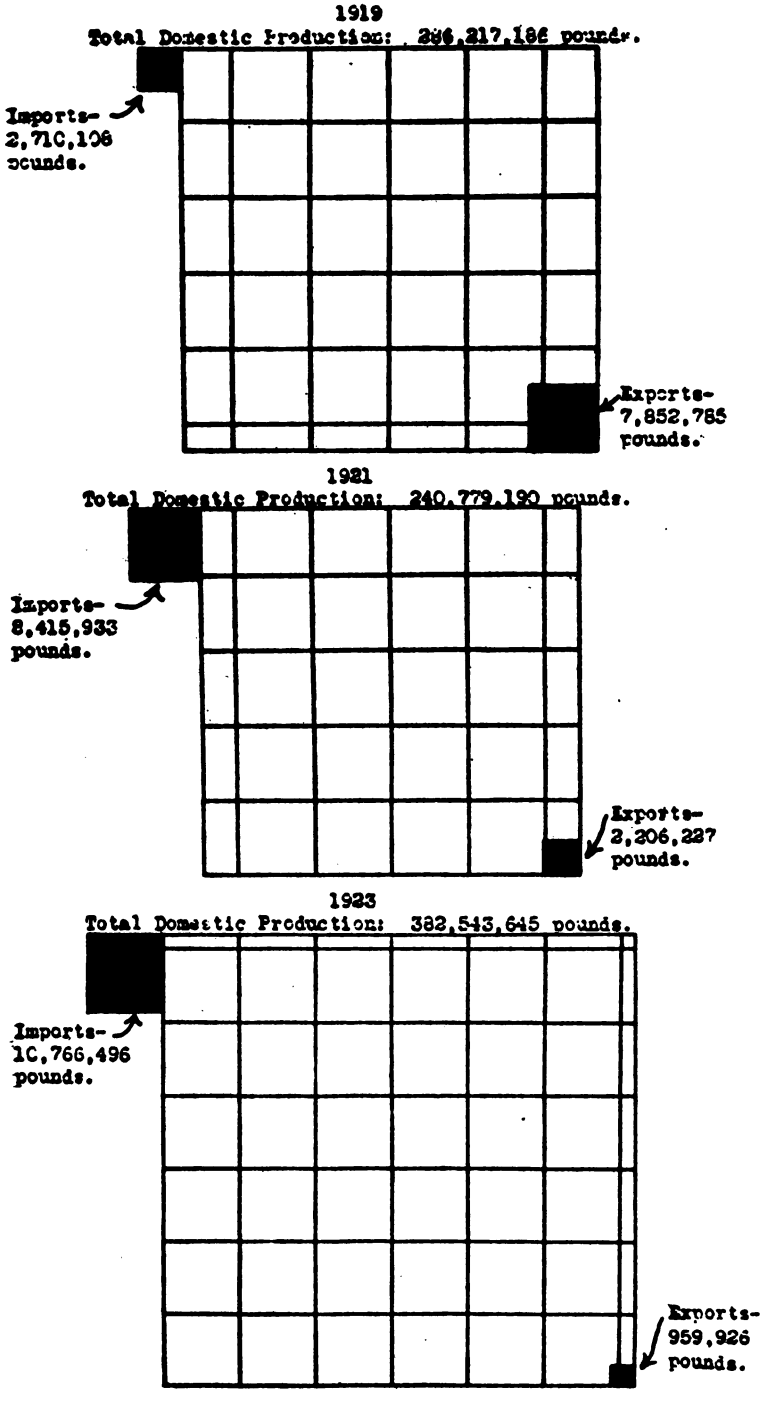
The following tabulation, comparing the value of imports and of domestic production of woolens and worsteds in each census year, 1889 to 1925,[1] shows that the ratio of imports to domestic production decreased steadily until 1914, and reached the lowest point in 1919. For a graphic illustration of the relation of imports to production in 1919, 1921, and 1923, see page 71.

Relation of value of imports to value of production

Census year:	Per cent	Census year—Continued.	Per cent
1889	19.17	1919	1.00
1899	5.65	1921	3.14
1904	5.43	1923	2.87
1909	4.16	1925	3.59
1914	7.85		

On January 1, 1914, the reduced duties on manufactures of wool provided in the tariff act of 1913 went into effect. These new rates, the general character of which may be gauged from the fact that the duty was 35 per cent ad valorem on cloths and dress goods of wool and 40 per cent on those made of mohair, 18 per cent on wool yarns,

[1] See Table 16, in the Appendix, p. 134.



Woolens and worsteds: Relation of imports and exports to domestic production; 1919, 1921, and 1923. Scale: 10,000,000 pounds to each small square.

and 8 per cent on wool tops, marked a substantial reduction from the rates of previous tariffs—a reduction even below the figures of the tariff law of 1894. Imports for consumption of woolen and worsted piece goods, in the six months preceding and following the change in rates of duty were as follows:

	Value	Duty collected	Ad valorem rate (per cent)
July 1 to Dec. 31, 1913	$8,722,158	$3,466,616	39.12
Jan. 1 to June 30, 1914	16,371,349	5,765,789	35.24

Much has been said relative to the effect of the tariff act of 1913 on the woolen and worsted industries, but for a clearer understanding of conditions existing in 1913 and 1914 it may be well to review the situation at that time. Both in 1911 and 1912 special bills for the revision and reduction of the wool schedule were under consideration by a Congress known to be opposed to the rates of duty of the 1909 act. In both these years bills embodying lower rates of duty were actually passed by both House and Senate and failed of becoming law only by the interposition of the veto of the President. The uncertainty attendant upon the discussion of these bills tended to cause a restriction of the woolen and worsted business in both periods.

A serious and protracted strike at Lawrence, Mass., in the early months of 1912, affecting several of the largest worsted mills in the country, and similar disturbances that followed at Passaic, N. J., and elsewhere, served also to reduce the production of woolen and worsted fabrics.

In the first months of 1913 a great strike prevailed among the garment workers of New York and other Eastern clothing centers. It is the manufacturers of ready-to-wear clothing who are the principal customers of the woolen and worsted manufacturers, and the partial paralysis of the clothing industry for several months compelled a further lessening of the production of wool fabrics.

Finally, when the time came in June and July, 1913, for the taking of orders for the spring season of 1914, the entire Underwood tariff bill, providing for free raw wool and a reduction in the duties on all kinds of wool goods, had been passed by the House of Representatives and was awaiting the action of the Senate. The enactment of the bill was assured, and it was anticipated that it might receive the signature of the President and be made at once effective, in time to apply to all goods required for the coming spring season. But unforeseen delay held up the final passage of the measure until October 3, 1913, and the reduced duties on wool goods were not to take effect until January 1, 1914.

In the earlier part of the summer, while the date of the enactment of the exact provisions of the new tariff bill was uncertain, the placing of orders for spring goods was deferred, thus shortening the time left for their manufacture. But by midsummer or soon after, it had become manifest that the new tariff would be passed too late for foreign competition to have any serious effect upon goods required for the spring of 1914. Because of the time needed for the many and varied manufacturing processes between the raw wool and the

finished cloth and then between the cloth and the finished garment, clothing manufacturers could delay no longer or their own establishments would be idle in October and November for want of material on which to work.

Meanwhile, lowered prices had been made by the mills, for in anticipation of free wool the prices of fine wools in this country had declined to a parity with foreign prices for similar wools—that is, fine wools were already selling in the United States in 1913 on a free-wool basis. The mills had made their prices when it seemed probable that August would see the new tariff in full effect. In the face of an intensified foreign competition and with a natural desire to keep their organizations intact if possible, many mills had made their prices without any regard to profit, content if they could earn expenses and hold their working force together until the results of the new tariff law could be determined by experience.

To sum up the situation, surplus stocks of wool goods on hand had become so exhausted by the tariff uncertainties of three successive years, 1911, 1912, and 1913, and by serious labor troubles, that if no unfavorable factor had been evident in the late summer and autumn of 1913 the demand for and sales of woolens and worsteds would have been much in excess of normal to make up for the accumulated deficiency of production in the previous years.

With a good spring season for 1914 assured to the American mills, there was inevitably an increase in the volume of orders shortly before and after the new tariff became a law. The mills that had named very low prices of course received a large amount of business. Thus, an anomalous combination of circumstances caused a number of mills to be busily employed during the winter of 1913–14.

The activity of woolen and worsted machinery was not recorded by the Government in 1913 and 1914. The National Association of Wool Manufacturers, however, made their first report as of December 1, 1913. The percentage of idle machinery on December 1, 1913, March 2, 1914, June 1, 1914, and September 1, 1914, was as follows:

Percentage of wool machinery idle in 1913 and 1914

Machinery	Ratio of idle to total reported			
	Dec. 1, 1913	Mar. 2, 1914	June 1, 1914	Sept. 1, 1914
	Per cent	*Per cent*	*Per cent*	*Per cent*
Woolen cards, sets	21.4	19.5	19.4	22.8
Worsted combs	23.1	13	15.5	21.0
Woolen spinning spindles	22.7	22.2	25.8	22.5
Worsted spinning spindles	26	22	18.1	16.9
Looms over 50-inch reed space	24.9	24.8	24.6	26.0
Looms 50-inch reed space or less	27.2	17.7	25	17.3

The above tabulation shows that there was less idle machinery after than before the new rates went into effect. As shown in preceding pages, the output had fallen behind demand, and the increase in demand in the spring of 1914, due in some degree to the lower prices permissible with free wool, stimulated both production and export trade as well as import trade.

In the fiscal year 1914 the woolens and worsteds imported into the United States were valued at 7.85 per cent of the value of the domestic production in that year. This was an increase attributable to an actual growth in imports and also to a decrease in the value of domestic production as compared with the figures for 1909. The decrease in value of domestic output in 1914 was largely due to lower costs and prices with wool on the free list. Whether or to what extent imports would have increased, after the fiscal year 1914, had there been no war, can not be determined. The latter part of 1914 saw American manufacturers exporting woolens and worsteds for military purposes.

GENERAL IMPORTS BY COUNTRIES

Prior to the World War the United Kingdom was the source of approximately one-half of the value of the woolens and worsteds imported into the United States. More than 45 per cent of the remainder came from France and Germany in about equal amounts. During the war practically all imports came from the United Kingdom; in 1918 about 10 per cent came from Canada; and in 1921 about 11 per cent from France. Imports from countries other than the United Kingdom have been mainly woolens. In 1919 the United Kingdom furnished 97 per cent of the value of our imports of woven fabrics of wool; in 1920, 84 per cent; and in 1925, 76 per cent. France accounted for 1 per cent in 1919 and 11 per cent in 1925. Imports from Germany were about 6 per cent of the total value in 1923 and 8 per cent in 1925.

Woven fabrics imported from the United Kingdom are mainly the higher grades of woolen and worsted suitings, overcoatings, and costume cloths. Imports of mohair and alpaca linings are practically all from the United Kingdom. These fabrics are worsteds and usually weigh under 4 ounces per square yard. They were classified statistically as dress goods prior to the enactment of the tariff law of 1913, when they were listed separately. Imports from France are mainly novelty fabrics for women's wear; those from Germany include woolen overcoatings and woolen and worsted suitings and dress goods; those from Belgium are chiefly woolens, particularly billiard cloths of the finer qualities for which that country has an established reputation.

Table 17, page 134, shows the percentage, in value, of the general imports of woven fabrics of wool from the United Kingdom, France, Germany, and Belgium, and from all other countries, from 1891 to 1925, inclusive.

DOMESTIC EXPORTS

Woven fabrics of wool were not separately recorded in export statistics prior to the calendar year 1918; and in the years 1918, 1919, 1920, and 1921, they were recorded only as one inclusive total. Exports in 1922 were statistically classified as worsted cloth, woolen cloth, cloth of mohair, and dress goods.[9] Exports in 1923 and subsequent years have been recorded in the following four classes: Wool cloth, cloth of mohair, dress goods, and other wool fabrics.

[9] It is interesting to note that in 1922, the only year for which there is statistical record of the relative amounts of woolens and worsteds, domestic exports consisted mainly of woolens.

Under the designation "wool manufactures, all other" (including carpets and rugs, blankets, etc., as well as cloths and dress goods, and excluding only wearing apparel), exports before 1914 were small, usually under $1,000,000 a year. They declined from 1909 to 1913. In the fiscal year 1914 they increased to $1,668,199; in 1916 they reached $33,331,873, declining to $13,435,946 in the fiscal year 1918.

Domestic exports of woven fabrics of wool since January 1, 1918, have been as follows:

Calendar year	Quantity	Value	Value per pound	Calendar year	Quantity	Value	Value per pound
	Pounds				*Pounds*		
1918	3,152,224	$8,686,888	$2.739	1923	1,031,903	$2,346,953	$2.274
1919	7,852,785	19,799,723	2.521	1924	637,036	1,331,775	2.091
1920	8,724,742	24,258,584	2.780	1925	547,374	1,132,971	2.070
1921	2,206,227	4,040,988	1.831	1926	432,822	872,235	2.015
1922	853,380	1,676,302	1.971				

The 1925 exports of woven fabrics of wool were statistically recorded as follows:

	Pounds	Yards	Value
Wool cloth	377,211	626,440	$812,895
Cloth of mohair	63,159	119,614	150,874
Wool dress goods	47,388	89,754	82,094
Other wool fabrics	59,616		87,108
Total	547,374		1,132,971

American exports of woolens and worsteds normally find their best markets in Canada and Cuba. The main purchasers in 1925 were Canada, Cuba, the Philippine Islands, Mexico, the United Kingdom, Brazil, Colombia, and Venezuela, in the order named.

It has always been assumed in England and other foreign wool manufacturing countries, as well as in the United States, that large exports of American wool manufactures were not practicable, (1) because of the relatively high duty on raw wool, in most tariff acts, and (2) because of the high cost of construction and equipment and the high wage cost of operation of American mills. The first obstacle might have been overcome under the tariff acts levying a duty on raw wool, by taking advantage of the 99 per cent rebate of duty on materials imported for manufacture into articles that were subsequently exported. This obstacle was entirely removed by the act of 1913 in placing raw wool on the free list.

In actual practice, domestic wool manufacturers have found the 99 per cent rebate of duty clause inoperative. Woolens and worsteds are usually composed of both foreign and domestic wools, and at the time of manufacture it is seldom known what portion of the cloths will be exported. The small amount of wool goods exported usually passes through the hands of a jobber, and it is difficult to show the amount of foreign wool on which a duty has been paid.

During the World War the largest domestic wool manufacturing corporation made a determined effort to secure foreign business. In 1917 branch offices were established in Canada, Cuba, Mexico,

five South American countries, and in the Far East. In 1919 exports by this company totaled $4,500,000. In 1921, however, the foreign offices were closed, as it was found impossible successfully to export American woolens and worsteds in competition with renewed exports on a large scale from Europe.

It is the opinion of those familiar with the trade that exports of woven fabrics of wool, even with free raw material, will not in the near future be any considerable portion of the domestic production. The relation of exports to domestic production in 1919, 1921, and 1923 is graphically illustrated on page 71.

TARIFF HISTORY

Cloths, woolen or worsted.—The tariff acts of 1890, 1897, 1909, and 1922 provided compound duties for wool cloths. In all of these acts the specific or compensatory portion of the rate was figured as a multiple of the duty on raw wool.

The act of 1890 classified cloths made wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals, into three classes, according to value, and provided specific rates of 33, 38½, and 44 cents per pound, respectively, and additional ad valorem duties of 40 per cent for the first and second groups and 50 per cent for the third. The duties on cloths in the tariff acts of 1897 and 1909 were identical; the three classes provided for bore specific duties of 33, 44, and 44 cents, respectively, and additional ad valorem rates of 50, 50, and 55 per cent, respectively. The tariff act of 1922 (in par. 1109) provides for three classes, according to value, with specific rates of 24, 37, and 45 cents per pound, respectively, and additional ad valorem duties of 40 per cent for the first and 50 per cent for the second and third. The specific rates of 24 and 37 cents apply to the fabric as a whole, while the 45-cents-per-pound rate applies to the wool content only.

The act of 1894 provided ad valorem rates of 40 and 50 per cent on wool cloths, classified according to value. The act of 1913 provided ad valorem rates of 35 and 40 per cent, respectively, on cloths made of wool and of mohair. The act of 1921 added to these ad valorem duties a specific duty of 45 cents a pound because of a duty of the same amount levied on raw wool and mohair.

Dress goods. The tariff acts of 1890, 1897, and 1909 provided compound duties on dress goods weighing not over 4 ounces per square yard and composed wholly or in part of wool, and also on those made with cotton warp. In these acts the specific portion of the rate was stated in terms of cents per square yard. Dress goods weighing over 4 ounces per square yard were dutiable as "cloths" and the specific portions of the rate were stated in terms of cents per pound.

The tariff act of 1890 classified cotton-warp dress goods weighing not over 4 ounces per square yard into two classes, based on the value per square yard, and provided specific rates of 7 and 8 cents per square yard, and additional ad valorem duties of 40 and 50 per cent, respectively. On dress goods composed wholly or in part of wool there was levied a specific rate of 12 cents per square yard and in addition an ad valorem duty of 50 per cent. On both all-wool and cotton-warp dress goods, weighing over 4 ounces per square yard, there was levied a specific duty of 44 cents per pound, and in addition an ad valorem duty of 50 per cent.

The rates of duty on dress goods in the tariff acts of 1897 and 1909 were identical, except that in the act of 1909 cotton-warp dress goods weighing over 4 ounces per square yard were dutiable at 5 per cent less than in the act of 1897. These two acts classified dress goods composed wholly or in part of wool, weighing not over 4 ounces per square yard, into two classes according to the value per pound; a specific duty of 11 cents per square yard applied to both classes and in addition an ad valorem duty of 50 per cent for the first and 55 per cent for the second. Cotton-warp dress goods, weighing not over 4 ounces per square yard, were classified according to the value per pound and the value per square yard; specific duties of 7 and 8 cents per square yard were provided and in addition ad valorem duties of 50 and 55 per cent. As previously noted, dress goods weighing over 4 ounces per square yard, woven either with or without cotton warp, were dutiable not as dress goods but as cloths.

The tariff act of 1894 provided ad valorem rates of 40 and 50 per cent on dress goods, classified according to value. The act of 1913 provided an ad valorem rate of 35 per cent for dress goods, wholly or in chief value of wool, and 40 per cent ad valorem on all fabrics made of mohair, alpaca, etc. The emergency tariff act of 1921 added to these ad valorem duties a specific duty of 45 cents a pound because of the duty of the same amount levied on raw wool and mohair.

The tariff act of 1922 (in par. 1108) provides for woven fabrics weighing not more than 4 ounces per square yard, wholly or in chief value of wool. On those made with a cotton warp a specific duty of 36 cents per pound is levied and in addition an ad valorem duty of 50 per cent. Those made wholly or in chief value of wool are divided into two classes, according to value, with specific rates of 37 and 45 cents per pound, respectively, and additional ad valorem duties of 50 per cent for both classes; the specific rate of 37 cents per pound applies to the fabric as a whole, while the 45 cents per pound rate applies to the wool content only.

Wool flannels.—The tariff acts of 1890, 1894, 1897, and 1909 made special provision for "flannels for underwear." The duties levied on these fabrics were lower than those imposed on other wool cloths, on the assumption that flannels were "an essential article" and "in universal use."

The acts of 1890, 1897, and 1909 provided compound duties for flannels for underwear; the specific portion of the rate was figured as a multiple of the duty on raw wool. In these acts flannels valued at more than 50 cents per pound were dutiable at the same rate as dress goods and those weighing over 4 ounces per square yard were dutiable as cloths.

The tariff act of 1890 classified flannels valued at not more than 50 cents per pound into three classes, according to value, and provided specific rates of 16½, 22, and 33 cents per pound, respectively, for each group and additional ad valorem duties of 30 per cent for the first and 35 per cent for the second and third. The duties of the the tariff acts of 1897 and 1909 were identical. Flannels valued at not more than 50 cents per pound were divided into two classes, according to value, and bore specific duties of 22 and 33 cents, and additional ad valorem duties of 30 and 35 per cent, respectively.

The tariff act of 1894 provided ad valorem rates of 25, 30, and 35 per cent on flannels for underwear, weighing not more than 4 ounces per square yard. These were classified according to value. In the act of 1913 the term "flannel" was used in place of the narrower designation "flannel for underwear" that had been used since 1890. This act provided for two groups, classified according to value, with ad valorem duties of 25 per cent for the first class and 30 per cent for the second.

Fabrics of mohair, alpaca, etc.—Under the tariff act of 1913 fabrics made of mohair, alpaca, etc., were dutiable at 40 per cent ad valorem. Under all other tariff acts such fabrics have been dutiable at the rates provided for fabrics of wool.

Compensatory duty.—In any analysis of compound duties on manufactures of wool, the specific duty must be set down to the account of the farmer or wool grower. It is there because the duty on raw wool is there and presumably for no other reason. The specific rates are intended to compensate the American manufacturer for the enhancement in price of his raw material attributable to the duty on the wool.

In the tariff acts of 1890, 1897, and 1909 the specific duties levied on woven fabrics of wool were based upon the assumption that it took 4 pounds of unwashed wool to make 1 pound of cloth. These compensatory rates ranged from 16½ to 44 cents per pound, according to the value of the fabric.

The specific duties levied on woven fabrics of wool in paragraphs 1108 and 1109 of the tariff act of 1922 were computed on the basis of data published in 1912 in the Report of the Tariff Board on Schedule K (see pp. 621–626) showing the loss in weight in the manufacture of scoured wool into worsted cloth. It was there stated that from 100 pounds of scoured wool there was normally produced 80 to 90 pounds, averaging around 85 pounds, of tops; that from 100 pounds of tops there was an average yield of at least 91 pounds of worsted yarn; and that from 100 pounds of worsted yarn there were obtained 85 to 95 pounds, averaging possibly 90 pounds, of worsted cloth. The average yield of worsted cloth from 100 pounds of scoured wool was therefore figured as 100 x 0.85 x 0.91 x 0.90, or 69.615 pounds. The duty paid on 100 pounds of scoured wool is $31, therefore $31 divided by 69.615 gives 44.53 cents—in round figures 45 cents—as the compensatory duty required on worsted cloths made entirely of wool. In the law it was specified that this "full compensatory" duty of 45 cents a pound should apply only to the wool content of the fabrics to which it related.

It was assumed that fabrics entered at low values necessarily contain cotton, shoddy, wool waste, or other materials which were free, or else dutiable at rates lower than 31 cents a pound, and therefore that on such goods the full compensatory duty of 45 cents a pound was too much. On woven fabrics of wool weighing not more than 4 ounces per square yard and valued at not more than 80 cents a pound the compensatory duty was fixed at 37 cents a pound, and on those made with warp wholly of cotton or other vegetable fiber at 36 cents a pound. On woven fabrics of wool weighing more than 4 ounces per square yard, the compensatory duty was fixed at 24 cents when the value of the fabric did not exceed 60 cents per pound and at 37 cents a pound when the value of the fabric exceeded 60 but did not exceed

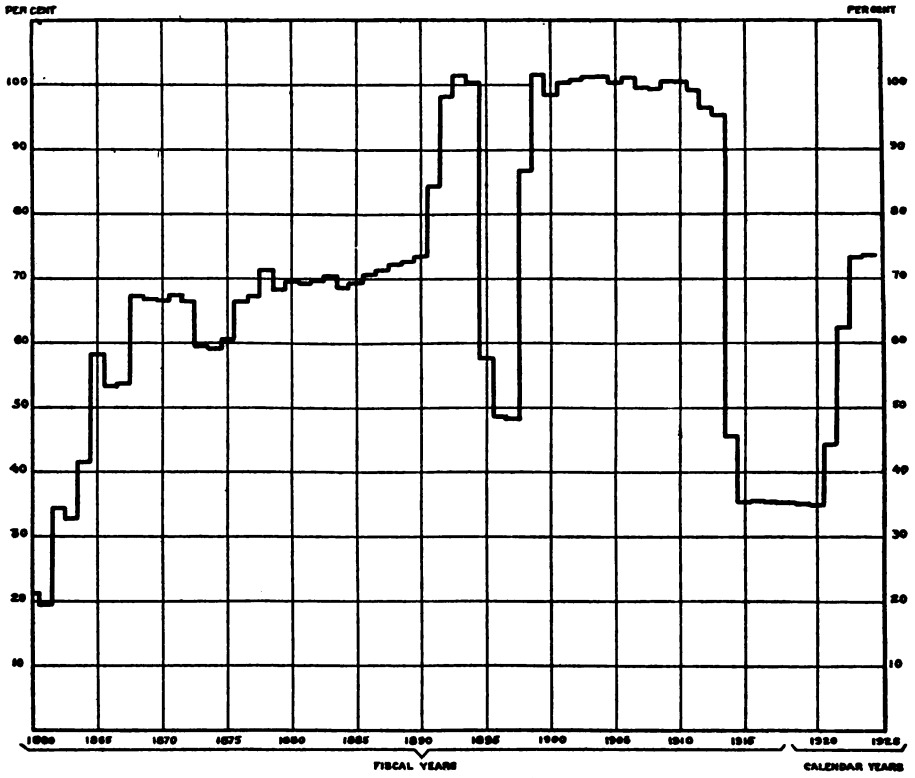
80 cents per pound. These reduced compensatory duties apply to the total weight of the fabric and not to the wool content only.

The following table, compiled from imports entered under paragraphs 1108 and 1109 in 1925, shows that about 30 per cent of the total duties collected on woven fabrics of wool were specific or compensatory. It should be noted, in reading all tables of imports showing an "equivalent ad valorem" rate of duty, that when the material is dutiable a substantial amount of the rate on the manufactured article is compensatory.

Specific and ad valorem duties collected under the provisions of paragraphs 1108 and 1109 on worsteds and woolens imported in 1925

Import classification	Duties collected			Per cent of total duty	
	Ad valorem	Specific	Total	Ad valorem	Specific
Woven fabrics wholly or in chief value of mohair:					
Weighing not over 4 ounces per square yard—					
Valued not over 80 cents per pound	$4.00	$3.70	$7.70	51.95	48.05
Valued over 80 cents per pound (mohair contents)	6,237.00	1,947.60	8,184.60	76.20	23.80
Warp of cotton or other vegetable fiber	96,527.50	31,334.04	127,861.54	75.49	24.51
Weighing over 4 ounces per square yard—					
Valued not over 60 cents per pound	40.80	94.08	134.88	30.25	69.75
Valued over 60 cents, not over 80 cents per pound	5.50	5.55	11.05	49.77	50.23
Valued over 80 cents per pound (mohair contents)	21,053.00	8,488.80	29,541.80	71.27	28.73
Woven fabrics wholly or in chief value of wool and other hair:					
Worsteds—					
Weighing not over 4 ounces per square yard—					
Valued not over 80 cents per pound	7.50	7.40	14.90	50.34	49.66
Valued over 80 cents per pound (wool contents)	22,583.50	7,629.30	30,212.80	74.75	25.25
Warp of cotton or other vegetable fiber	16,026.00	5,756.40	21,782.40	73.57	26.43
Weighing over 4 ounces per square yard—					
Valued not over 60 cents per pound	4,457.20	5,421.12	9,878.32	45.12	54.88
Valued over 60 cents, not over 80 cents per pound	2,268.50	2,429.42	4,697.92	48.29	51.71
Valued over 80 cents per pound (wool contents)	1,068,863.00	317,410.65	1,386,273.65	77.10	22.90
Woolens—					
Weighing not over 4 ounces per square yard—					
Valued not over 80 cents per pound	836.50	910.20	1,746.70	47.89	52.11
Valued over 80 cents per pound (wool contents)	314,001.50	79,684.65	393,686.15	79.76	20.24
Warp of cotton or other vegetable fiber	767,645.00	276,010.56	1,043,655.56	73.55	26.45
Weighing over 4 ounces per square yard—					
Valued not over 60 cents per pound	88,204.80	95,924.88	184,129.68	47.90	52.10
Valued over 60 cents, not over 80 cents per pound	82,734.50	89,892.24	172,626.74	47.93	52.07
Valued over 80 cents per pound (wool contents)	8,496,668.50	3,681,967.50	12,178,636.00	69.77	30.23
Total	10,968,164.30	4,604,918.09	15,593,082.39	70.47	29.53

Ad valorem duty.—The ad valorem duty is intended to equalize the difference in conversion costs here and abroad. In considering its proper adjustment it is necessary to look upon this ad valorem duty as though it were the only duty upon wool goods, the specific duty being necessitated by and designed to offset the wool duty. On the assumption that the average foreign conversion costs were two-thirds of the American, this duty was fixed at 50 per cent ad valorem on all woven fabrics of wool dutiable under paragraphs 1108 and 1109 of the tariff act of 1922, with only one exception. This exception was woven fabrics weighing more than 4 ounces per square yard and



Equivalent ad valorem rates of duty on imports of woolen and worsted fabrics, 1860–1924

valued at less than 60 cents per pound; on these cheap low-grade fabrics the ad valorem duty was reduced to 40 per cent on the assumption that the conversion cost was a smaller proportion of the total cost than on fabrics of better grade and value.

WORDING OF TARIFF ACTS OF 1890 TO 1922, INCLUSIVE

In the tariff acts of 1890, 1894, 1897, 1909, and 1913, woolens and worsteds were divided into (a) cloths, (b) dress goods, coat linings, Italian cloths, bunting, and similar goods, and (c) flannels. The word "cloths" is used in the wool industry in a restrictive sense to denote fabrics, used mainly for men's wear, heavier than the general run of dress goods. There is, however, no clear line of demar-

cation between the two; for instance, some types of dress goods are heavier than cloths used for men's summer suits. In the tariff acts of 1897 (par. 369) and 1909 (par. 381) it was therefore stipulated that women's and children's dress goods, linings, etc., weighing over 4 ounces per square yard should be considered "cloths." Irrespective of the use of the fabrics or the trade terminology employed, therefore, woolens and worsteds were primarily classified according to weight. This fact logically led to the procedure adopted in the tariff act of 1922, i. e., the discarding of trade terms such as cloths and dress goods, and the classifying of woolens and worsteds into two paragraphs, one of which (1108) covers those weighing not over 4 ounces per square yard, and the other (1109) covering those weighing over 4 ounces per square yard. The classification adopted in 1922 is therefore practically the same as that previously used but with the omission of unnecessary verbiage. The omission of any specific mention of "flannels" in the act of 1922 stops litigation as to what is or is not "flannel" and permits such goods to enter on a parity with other woven fabrics of wool, under paragraph 1108 or under paragraph 1109, according to their weight. The wording used in the tariff acts of 1890 to 1922, inclusive, to cover woolens and worsteds is given below.

Rates of duty

WOOL CLOTHS

Act of—	Par.	Tariff classification or description	Rates of duty
1890	392	On woolen and worsted cloths, * * * and all manufactures of every description made wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals, not specially provided for in this act, valued at not more than 30 cents per pound, the duty per pound shall be three times the duty imposed by this act on a pound of unwashed wool of the first class, and in addition thereto 40 per centum ad valorem; valued at more than 30 and not more than 40 cents per pound, the duty per pound shall be three and one-half times the duty imposed by this act on a pound of unwashed wool of the first class, and in addition thereto 40 per centum ad valorem; valued at above 40 cents per pound, the duty per pound shall be four times the duty imposed by this act on a pound of unwashed wool of the first class, and in addition thereto 50 per centum ad valorem.	
		Summary:	
		Valued at not more than 30 cents per pound	33 cents per pound and 40 per cent ad valorem.
		Valued at more than 30 but not more than 40 cents per pound.	38½ cents per pound and 40 per cent ad valorem.
		Valued at more than 40 cents per pound	44 cents per pound and 50 per cent ad valorem.
1894	283	On women's and children's dress goods, coat linings, Italian cloth, bunting, or goods of similar description or character, and on all manufactures, composed wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals, including such as have India rubber as a component material, and not specially provided for in this act, valued at not over 50 cents per pound, 40 per centum ad valorem; valued at more than 50 cents per pound, 50 per centum ad valorem.	
		Summary:	
		Valued at not more than 50 cents per pound	40 per cent ad valorem.
		Valued at more than 50 cents per pound	50 per cent ad valorem.

Rates of duty—Continued

WOOL CLOTHS—Continued

Act of—	Par.	Tariff classification or description	Rates of duty
1897	366	On cloths, * * * and all manufactures of every description made wholly or in part of wool, not specially provided for in this Act, valued at not more than 40 cents per pound, the duty per pound shall be three times the duty imposed by this Act on a pound of unwashed wool of the first class; valued at above 40 cents per pound and not above 70 cents per pound, the duty per pound shall be four times the duty imposed by this Act on one pound of unwashed wool of the first class, and in addition thereto, upon all the foregoing, 50 per centum ad valorem; valued at over 70 cents per pound, the duty per pound shall be four times the duty imposed by this Act on one pound of unwashed wool of the first class and 55 per centum ad valorem.	
		Summary:	
		Valued at not more than 40 cents per pound	33 cents per pound and 50 per cent ad valorem.
		Valued at more than 40 but not more than 70 cents per pound.	44 cents per pound and 50 per cent ad valorem.
		Valued at more than 70 cents per pound	44 cents per pound and 55 per cent ad valorem
1909	378	On cloths, * * * and all manufactures of every description made wholly or in part of wool, not specially provided for in this section, valued at not more than 40 cents per pound, the duty per pound shall be three times the duty imposed by this section on a pound of unwashed wool of the first class; valued at above 40 cents per pound and not above 70 cents per pound, the duty per pound shall be four times the duty imposed by this section on one pound of unwashed wool of the first class, and in addition thereto, upon all the foregoing, 50 per centum ad valorem; valued at over 70 cents per pound, the duty per pound shall be four times the duty imposed by this section on one pound of unwashed wool of the first class and 55 per centum ad valorem.	
		Summary:	
		Valued at not more than 40 cents per pound	33 cents per pound and 50 per cent ad valorem.
		Valued at more than 40 but not more than 70 cents per pound.	44 cents per pound and 50 per cent ad valorem.
		Valued at more than 70 cents per pound	44 cents per pound and 55 per cent ad valorem.
1913	288	Cloths, * * * and all manufactures of every description made, by any process, wholly or in chief value of wool, not specially provided for in this section.	35 per centum ad valorem.
1921	19	Wool and hair of the kind provided for in paragraph 18, when advanced in any manner or by any process of manufacture beyond the washed or scoured condition, and manufactures of which wool or hair of the kind provided for in paragraph 18 is the component material of chief value, 45 cents per pound in addition to the rates of duty imposed thereon by existing law.	45 cents per pound and 35 per cent ad valorem.
1922	1109	Woven fabrics, weighing more than 4 ounces per square yard, wholly or in chief value of wool, valued at not more than 60 cents per pound, 24 cents per pound and 40 per centum ad valorem; valued at more than 60 cents but not more than 80 cents per pound, 37 cents per pound and 50 per centum ad valorem; valued at more than 80 cents but not more than $1.50 per pound, 45 cents per pound upon the wool content thereof and 50 per centum ad valorem; valued at more than $1.50 per pound, 45 cents per pound upon the wool content thereof and 50 per centum ad valorem.	
		Summary:	
		Valued at not more than 60 cents per pound	24 cents per pound and 40 per cent ad valorem.
		Valued at more than 60 but not more than 80 cents per pound.	37 cents per pound and 50 per cent ad valorem.
		Valued at more than 80 cents per pound	45 cents per pound [1] and 50 per cent ad valorem.

DRESS GOODS

Act of—	Par.	Tariff classification or description	Rates of duty
1909	384	On women's and children's dress goods, coat linings, Italian cloths, and goods of similar character or description of which the warp consists wholly of cotton or other vegetable material, with the remainder of the fabric composed wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals, valued at not exceeding 15 cents per square yard, 7 cents per square yard, and in addition thereto 40 per centum ad valorem; valued at above 15 cents per square yard, 8 cents per square yard, and in addition thereto 50 per centum ad valorem: *Provided*, That on all such goods weighing over 4 ounces per square yard the duty per pound shall be four times the duty imposed by this act on a pound of unwashed wool of the first class, and in addition thereto 50 percentum ad valorem.	
		Summary:	
		Cotton warp—	
		Weighing not over 4 ounces per square yard—	
		Valued at not over 15 cents per square yard	7 cents per square yard and 40 per cent ad valorem.
		Valued at over 15 cents per square yard	8 cents per square yard and 50 per cent ad valorem.
		Weighing over 4 ounces per square yard	44 cents per pound and 50 per cent ad valorem.
	385	On women's and children's dress goods, coat linings, Italian cloths, bunting, and goods of a similar description or character composed wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals, and not specially provided for in this act, the duty shall be 12 cents per square yard, and in addition thereto 50 per centum ad valorem: *Provided*, That on all such goods weighing over 4 ounces per square yard the duty per pound shall be four times the duty imposed by this act on a pound of unwashed wool of the first class and in addition thereto 50 per centum ad valorem.	
		Summary:	
		Composed wholly or in part of wool—	
		Weighing not over 4 ounces per square yard	12 cents per square yard and 50 per cent ad valorem.
		Weighing over 4 ounces per square yard	44 cents per pound and 50 per cent ad valorem.
1894	253	On women's and children's dress goods, coat linings, Italian cloth, bunting, or goods of similar description or character, and on all manufactures, composed wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals, including such as have India rubber as a component material, and not specially provided for in this Act, valued at not over 30 cents per pound, 40 per centum ad valorem: valued at more than 30 cents per pound, 50 per centum ad valorem.	
		Summary	
		Valued at not over 30 cents per pound	40 per cent ad valorem.
		Valued at over 30 cents per pound	50 per cent ad valorem.
1897	268	On women's and children's dress goods, coat linings, Italian cloths, and goods of similar description and character of which the warp consists wholly of cotton or other vegetable material with the remainder of the fabric composed wholly or in part of wool, valued at not exceeding 15 cents per square yard, the duty shall be 7 cents per square yard: valued at more than 15 cents per square yard, the duty shall be 8 cents per square yard; and in addition thereto on all the foregoing valued at not above 70 cents per pound, 40 per centum ad valorem; valued above 70 cents per pound, 55 per centum ad valorem: *Provided*, That on all the foregoing, weighing over 4 ounces per square yard, the duty shall be the same as imposed by this schedule on cloths.	
		Summary	
		Cotton warp—	
		Weighing not over 4 ounces per square yard—	
		Valued at not over 70 cents per pound—	
		Valued at not over 15 cents per square yard	7 cents per square yard and 40 per cent ad valorem.
		Valued at over 15 cents per square yard	8 cents per square yard and 40 per cent ad valorem.
		Valued at over 70 cents per pound—	
		Valued at not over 15 cents per square yard	7 cents per square yard and 55 per cent ad valorem.
		Valued at over 15 cents per square yard	8 cents per square yard and 55 per cent ad valorem.
		Weighing over 4 ounces per square yard—	
		Valued at not over 40 cents per pound	33 cents per pound and 50 per cent ad valorem.
		Valued at over 40 but not over 70 cents per pound	44 cents per pound and 50 per cent ad valorem.
		Valued at over 70 cents per pound	44 cents per pound and 55 per cent ad valorem.

DRESS GOODS—Continued

Act of—	Par.	Tariff classification or description	Rates of duty
1913	290	Women's and children's dress goods, coat linings, Italian cloths, bunting, and goods of similar description and character, composed wholly or in chief value of wool, and not specially provided for in this section.	35 per cent ad valorem.
1921	19	Wool and hair of the kind provided for in paragraph 18, when advanced in any manner or by any process of manufacture beyond the washed or scoured condition, and manufactures of which wool or hair of the kind provided for in paragraph 18 is the component material of chief value, 45 cents per pound in addition to the rates of duty imposed thereon by existing law.	45 cents per pound and 35 per cent ad valorem.
1922	1108	Woven fabrics, weighing not more than 4 ounces per square yard, wholly or in chief value of wool, valued at not more than 80 cents per pound, 37 cents per pound and 50 per centum ad valorem; valued at more than 80 cents per pound, 45 cents per pound upon the wool content thereof and 50 per centum ad valorem: *Provided*, That if the warp of any of the foregoing is wholly of cotton or other vegetable fibre, the duty shall be 36 cents per pound and 50 per centum ad valorem.	
		Summary:	
		Valued at not more than 80 cents per pound	37 cents per pound and 50 per cent ad valorem.
		Valued at more than 80 cents per pound	45 cents per pound [1] and 50 per cent ad valorem.
		Made with cotton warp	36 cents per pound and 50 per cent ad valorem.

WOOL FLANNELS

1890	393	* * * flannels for underwear composed wholly or in part of wool, the hair of the camel, goat, alpaca, or other animals, valued at not more than 30 cents per pound, the duty per pound shall be the same as the duty imposed by this act on one pound and one-half of unwashed wool of the first class, and in addition thereto 30 per centum ad valorem; valued at more than 30 and not more than 40 cents per pound, the duty per pound shall be twice the duty imposed by this act on a pound of unwashed wool of the first class; valued at more than 40 cents and not more than 50 cents per pound, the duty per pound shall be three times the duty imposed by this act on a pound of unwashed wool of the first class; and in addition thereto upon all the above-named articles 35 per centum ad valorem.	
		* * * Flannels composed wholly or in part of wool, the hair of the camel, goat, alpaca, or other animals, valued at above 50 cents per pound shall be classified and pay the same duty as women's and children's dress goods, coat linings, Italian cloths, and goods of similar character and description provided by this act.	
		Summary:	
		Valued at not more than 30 cents per pound	16½ cents per pound and 30 per cent ad valorem.
		Valued at more than 30 and not more than 40 cents per pound.	22 cents per pound and 35 per cent ad valorem.
		Valued at more than 40 cents and not more than 50 cents per pound.	33 cents per pound and 35 per cent ad valorem.
		Wool flannels weighing over 4 ounces per square yard	44 cents per pound and 50 per cent ad valorem.
1894	282	* * * flannels for underwear, * * * composed wholly or in part of wool, the hair of the camel, goat, alpaca, or other animals, valued at not more than 30 cents per pound, 25 per centum ad valorem; valued at more than 30 and not more than 40 cents per pound, 30 per centum ad valorem; valued at more than 40 cents per pound, 35 per centum ad valorem: *Provided*, * * * on flannels weighing over 4 ounces per square yard, the same duties as on dress goods.	
		Summary:	
		Valued at not more than 30 cents per pound	25 per cent ad valorem.
		Valued at more than 30 and not more than 40 cents per pound	30 per cent ad valorem.
		Valued at more than 40 cents per pound	35 per cent ad valorem.
		Weighing over 4 ounces per square yard—	
		Valued at not more than 50 cents per pound	40 per cent ad valorem.
		Valued at more than 50 cents per pound	50 per cent ad valorem.

		Valued at above 50 cents per pound	45 cents per pound and 30 per cent ad valorem.

COURT AND TREASURY DECISIONS

WOOLENS AND WORSTEDS

The deduction of 5 per cent on goods weighing over 4 ounces per square yard in the proviso to paragraph 380 of the act of 1909 was held to be one-twentieth of the duties and not 5 per cent ad valorem. Auffmordt *v.* United States, 2 Ct. Cust Appls. 481, of 1912. Pekin melange was held dutiable as wool dress goods under paragraph 380 of the act of 1909 rather than as manufactures of wool under paragraph 378. (Abstract 26267, T. D. 31813, of 1911.) Canton cloth, described as "Fawn Canton," consisting of a cloth with a wool weft and a cotton warp, generally used in the manufacture of waterproof cloth, was held dutiable under paragraph 380 of the act of 1909. (Abstract 30639, T. D. 32997, of 1912, following Abstract 26270, T. D. 31813, supra.) Automobile cloth, which was also adapted to use as dress goods and was in fact sometimes so used, was held properly dutiable as "goods of similar description and character" to women's dress goods under paragraph 380 of the act of 1909 and not as wool cloth under paragraph 378. (G. A. 7544, T. D. 34303, of 1914.)

Cloth of mohair and wool invoiced as "sateen" or "standard," with the warp yarn of wool and the weft yarn of mohair and wool, and the wool in the two yarns being more valuable than the mohair, was held to be dutiable under paragraph 288 of the act of 1913, as cloth in chief value of wool and not under paragraph 308 as cloth in chief value of the hair of the Angora goat. (Field *v.* United States, 7 Ct. Cust. Appls. 332, of 1916.)

Green-baize wool cloth, 36, 45, 54, and 72 inches wide and about 30 yards long, claimed to be dutiable as "bockings," was held dutiable as wool cloth under paragraph 288 of the act of 1913, the testimony being insufficient to establish a commercial designation of the term "bockings" in paragraph 301. (Abstract 39843, of 1916.)

Textile fabric, the distinguishing feature of which was an even, unbroken surface, ornamented in the making with figures and designs in colored threads or yarns, was declared to be tapestry and dutiable as cloths or as manufactures of wool under paragraph 288 of the act of 1913 and not as embroidery under paragraph 358. (Sloane *v.* United States, 7 Ct. Cust. Appls. 463, of 1917.) Wool cloth teaseled was held to be dutiable as wool cloth under paragraphs 288 and 308 of the act of 1913. (Abstract 40293, of 1916, following G. A. 7906, T. D. 36403.)

Omission from paragraph 289 of the 1913 act of the words "for underwear" following the word "flannels" in paragraph 379 of the act of 1909 gave rise to considerable litigation. Woolen flannel material used for outer garments, and also for pajamas, etc., was held to be within the commercial meaning of the term "flannels" in this paragraph, and not dutiable as manufactures of wool under paragraph 288 of the act of 1913, nor as wool dress goods under paragraph 290. The testimony showed "flannel" to be defined as a fabric composed of wool, or cotton and wool, or wool and silk, woven in a certain way and having a certain finish, used for skirts and underwear, dressing sacks, and possibly for infants' wear, also for pajamas and trousers. (G. A. 7772, T. D. 35703, of 1915, and Abstract

38781, of 1915.) Woven wool fabrics, reported to be of the character used for women's dress goods (Abstract 38439, of 1915), and French flannels used for underwear and infants' wear (Abstract 38782, of 1915) were likewise classified as flannels, following T. D. 35703, supra. Shirting flannels used for waists, shirts, and infants' wear were also held so classable. (Abstract 39393, of 1916, followed in Abstract 40295, of 1916.)

However, certain wool cloth was held dutiable under paragraph 288 of the act of 1913, the record not showing that the merchandise was included within the commercial meanings of the term "flannels" as found in T. D. 35703, supra. (Abstract 38441, of 1915.) Wool suitings, distinguishable in their characteristics and texture from those found to be flannels in T. D. 35703 and Abstract 39393, and no commercial designation being shown, were also held dutiable as manufactures of wool under paragraph 288. (G. A. 7992, T. D. 36837, of 1916, followed in Abstract 40724, of 1917.) Wool suitings for trousers, etc., were likewise classified. The board pointed out that the sharp conflict in testimony argued against the existence of a commercial designation that was definite, uniform, and general. Although the distinguishing characteristics between flannels and other woolen fabrics were indicated by witnesses, the board said, "Yet it seems that these distinguishing characteristics and differences between goods that are flannels and goods that are not flannels are not apparent from an examination of a particular sample except to an expert in the trade. It would seem, then, in general that no definite or fixed rule or test can be applied to determine whether or not a certain fabric is a flannel, but each case must depend upon the particular testimony presented therein." (Abstract 40403, of 1916.) But in a later case it was held that while paragraph 379 of the tariff act of 1909 was limited to flannels for underwear, its successor, paragraph 289, act of 1913, covered all flannels regardless of use. The Government failed to establish for the word "flannels" a commercial designation different from the common meaning. The decision of the Board of General Appraisers sustaining the collector's classification as cloths composed wholly or in chief value of wool under paragraph 288 of the act of 1913, or as women's and children's dress goods composed wholly or in chief value of wool under paragraph 290, and overruling protests claiming classification as flannels under paragraph 289, was reversed except as to certain items admitted by importer's witnesses not to be flannels. (Connor *v.* United States, 9 Ct. Cust. Appls. 312; followed in many abstract decisions.)

Slasher flannel, used in cotton mills on slasher machines, and the clearer cloth on spinning machines, was found not to come within the meaning of the term "flannels," they having no relation to clothing and being used entirely in connection with machinery. (Abstract 39970, of 1916.)

The form and manner in which the amendments were adopted by the Senate show that the words "upon the wool content thereof" in paragraph 1108, act of 1922, were not intended to limit the application of all specific duties mentioned in said paragraph but only those with which they are directly associated as literally written. G. A. 8905, T. D. 40554, of 1924, followed in Abstract 50245 of 1925, which was affirmed in Brauer *v.* United States, 14 Ct. Cust. Appls. —; T. D. 41577, of 1926, in which the Court of Customs Appeals held that para-

graph 1108, tariff act of 1922, provides for woven fabrics, wholly or in chief value of wool, weighing not more than 4 ounces per square yard: (1) valued at not more than 80 cents per pound; (2) valued at more than 80 cents per pound; (3) with a warp wholly of cotton or other vegetable fiber, without regard to value; that under the rule of *expressio unis est exclusio alterius*, the provision that specific duty shall be taken on the wool content applies to the second clause only, which is borne out by the application of grammatical rules to the paragraph and by its legislative history, and that woven fabrics in chief value of wool having a cotton warp weighing not more than 4 ounces per square yard, valued at more than 80 cents per pound, are dutiable under clause 3 according to the weight of the fabric, and not according to the weight of its wool content.

Bolts of woolen cloth intended to be cut up by the importer and made into suits of clothes to be sold to retail dealers were held subject to marking under section 304 (a) of the act of 1922, and Treasury Decision 39359, wherein it is specifically required that "textile and piece goods must be marked to indicate the country of origin, the mark to appear either directly on the roll, bolt, or piece, or on a tag securely fastened thereto." The marking requirement applies to the goods per se in their condition as imported, and marking to indicate the country of origin is alike required whether the goods are to be used commercially by the importer, as in this case, or sold to others. (T. D. 40547, par. (4), of 1924.)

Cloth composed of common goat hair and wool in equal proportions in weight was held to be dutiable at 50 per cent ad valorem under paragraph 1109 and 45 cents per pound upon the wool content alone, excluding the weight of the common goat hair, the words "45 cents per pound upon the wool content" not applying literally to goat hair. (Abstract 47828, of 1924.)

Woolen fabrics dutiable under paragraph 1109, act of 1922, at a rate depending upon value per pound, were entered as 894 pounds, at a value of $715.20, plus $8 for the containers. The entered value was approved by the appraiser. The collector divided the appraised value, $723.20, by the weight and classified the goods according to the value per pound thus found. His action was held to be correct. It was furthermore held that the appraiser can make but one appraisement, and that neither his later return to the Comptroller of Customs nor his answer to the protest can be regarded as an appraisement, nor can they modify or change the amount or character of the appraisement already made by him. United States *v.* Dorn (13 Ct. Cust. Appls. 130, of 1925), reversing G. A. 8877, T. D. 40446, holding that the value of containers should not be included in arriving at the value per pound of wool cloth.

Woven fabrics in chief value of wool, weighing over 4 ounces per square yard and valued at more than 80 cents per pound, were held dutiable at the 45-cent rate on the weight of the wool content, and not on the net weight of the entire fabric. (Abstract 49472, of 1925.)

Upholstery fabrics of wool and cotton, wool chief value, valued at more than 80 cents per pound and weighing more than 4 ounces to the square yard, imported to be later cut up into chair seats or chair backs, were held to be more specifically described as woven fabrics under paragraph 1109 of the act of 1922 than as manufactures of wool

under paragraph 1119. (G. A. 9035, T. D. 41115, of 1925; affirmed in Rogers *v.* United States, 14 Ct. Cust. Appls. —; T. D. 41552, of 1926.)

The provision in paragraph 1109 for woven woolen fabrics means cloth or material in the piece and not further manufactured. Samples of woolen cloth are articles made from woolen fabrics and are not classable as woolen fabrics under paragraph 1109 but as woolen manufactures not specially provided for under paragraph 1119. (United States *v.* Milbank, 14 Ct. Cust. Appls. —; T. D. 41693, of 1926, followed in Abstract (N) 2484, of 1927.)

PART 2

PILE FABRICS OF WOOL, MOHAIR, ALPACA, ETC., AND MANUFACTURES OF

TARIFF ACT OF SEPTEMBER 21, 1922

PAR. 1110.—Pile fabrics, cut or uncut, whether or not the pile covers the whole surface, made wholly or in chief value of wool, and manufactures, in any form, made or cut from such pile fabrics, 40 cents per pound and 50 per centum ad valorem.

DESCRIPTION

Pile fabrics consist of a foundation cloth covered in whole or in part by short projecting ends or loops made with an extra set of threads. Technically, pile fabrics are divided according to method of construction into two classes: (1) Filling piles, such as corduroy, and (2) warp piles, such as plush and astrachan. In all these the foundation fabric requires its own set of warp and filling threads, and the pile, whether filling or warp, is made from an additional set of threads. In most fabrics made with a pile of wool, mohair, or alpaca the foundation fabric is of cotton or other vegetable fiber. Filling pile is always cut, whereas warp pile may be either cut or loop (uncut).

Wool, because of its lack of resilience and its tendency to felt, is little used as pile. When so employed, for women's cloaks, for hangings, etc., it is usually of the light-shrinking and coarse variety. Pile fabrics of alpaca, like those of wool, are relatively unimportant.

Fabrics made with mohair pile constitute the bulk of the pile fabrics imported under the wool schedule. Under the act of 1913 mohair pile fabrics amounted to about 80 per cent of the total. There is no better material than mohair plush for upholstery; it has great durability, is pleasing in appearance, and it resists the retention of dust. These qualifications have gained great favor in the American automobile industry, which uses large and increasing quantities for upholstery in motor vehicles. Mohair pile fabrics are also used for covering seats in Pullman railway cars, for curtains and portières, for women's and children's cloaks, and for covering teddy bears and other toys.

DOMESTIC PRODUCTION

The production of pile fabrics is not separately recorded by the census but is included with other manufactures of wool. It is known, however, that it constitutes a relatively small part of the wool manufacturing industry. The census of war commodities reported the production of "plush" on 434 looms as 4,329,184 linear yards in 1916 and as 3,975,090 linear yards in 1917. Since the war the increasing popularity of the inclosed automobile has created such a demand for pile fabrics that it is estimated 1,500 looms were engaged in the manufacture of plush in 1925.

The mohair used in the manufacture of plush is partly of foreign and partly of domestic production. The cotton yarns used are mainly domestic. Wool and alpaca are used for pile to a minor extent; there is a small use of other materials such as silk and rayon, particularly spun silk and spun rayon, in mixed pile specialties. The manufacture of plushes and other pile fabrics is conducted chiefly in Maine, Rhode Island, Connecticut, and Pennsylvania. Exports are not separately recorded but are known to be comparatively small.

Methods of production.—The manufacture of mohair plushes and similar pile fabrics is a branch of the worsted industry. The mohair and wool yarns are usually spun on the Bradford system. It is in the weaving and finishing departments that the plush mill differs from the ordinary worsted cloth mill.

Prior to 1867 the manufacture of plushes was confined to France and Germany, where the peculiar looms employed were kept under the closest surveillance. Repeated attempts to procure this machinery abroad were frustrated, and the result was the invention of American patterns. These looms now produce a fabric in every way equal to the best plushes made abroad, and with much greater economy of labor.

IMPORTS

The average annual imports for consumption and duties collected during the operation of the last five tariff acts are compared, in the following table, with imports for consumption and duties collected in 1923, 1924, 1925, and 1926:

Pile fabrics of wool, mohair, etc.—Imports for consumption—Average per year of 365 days, acts of 1890–1922

	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate	Equivalent specific rate
Tariff act of—	*Pounds*				*Per cent*	*Per pound*
1890	154,852	$144,274	$163,216	$0.932	113.13	$1.054
1894	117,498	120,961	60,431	1.029	49.96	.514
1897	16,267	18,457	17,198	1.135	93.18	1.057
1909	11,893	12,216	11,887	1.027	97.31	.999
1913	89,764	126,335	61,401	1.407	48.60	.684
1922—						
Calendar year 1923	246,731	434,437	315,911	1.761	72.72	1.280
Calendar year 1924	122,117	242,148	169,921	1.963	70.17	1.391
Calendar year 1925	129,781	276,716	190,270	2.132	68.76	1.466
Calendar year 1926	243,439	509,017	351,884	2.091	69.13	1.445

The above, taken in connection with the more detailed Table 23, page 139, shows that imports of pile fabrics are normally small, but have fluctuated widely from year to year. Imports in 1892 amounted to 247,565 pounds, valued at $214,267; in 1902 to 3,651 pounds, valued at $4,391; in 1914 to 249,979 pounds, valued at $279,698; in 1919 to 7,365 pounds, valued at $23,074; in 1923 to 246,731 pounds, valued at $434,437; and in 1926 to 243,439 pounds, valued at $509,017. During this period, 1891–1926, the record quantity was attained in 1914 and the record value in 1926.

Pile fabrics partake of the nature of specialties and the demand is more dependent on style than on price, so that the rate of duty is usually a minor factor in influencing imports. Imports were larger

under the high rates of the act of 1890 than under the lower rates of the act of 1894. Under the high rates of the acts of 1897 and 1909 imports were negligible and there was a substantial increase when lower duties were put into effect in 1913, but there was also a substantial increase when higher duties were put into effect with the present act.

Imports of manufactures of pile fabrics were not separately recorded prior to the act of 1913. During that act they averaged annually $47,024 in value (quantity not recorded), dutiable at $20,624, the equivalent ad valorem rate of duty being 43.86 per cent. In the calendar year 1923 imports increased to 101,013 pounds, valued at $180,822, paying duty of $130,816, although the equivalent ad valorem rate of duty had increased to 72.34 per cent. The equivalent specific duty amounted to $1.29 a pound. The substantial increase in these imports tends to show that the rate of duty is a minor factor and that the demand for these goods of foreign manufacture is dependent mainly on style or quality. In 1926 imports were 53,454 pounds, valued at $118,938.

PRICES

The prices of domestic pile fabrics usually follow those of other woven fabrics of wool. Owing to the variation in style from season to season, no prices are available covering a period of years. Imported pile fabrics of wool, mohair, etc., averaged, per pound, $0.932 under the act of 1890, $1.029 under the act of 1894, $1.135 under the act of 1897, $1.027 under the act of 1909, and $1.407 under the act of 1913. Imports in 1925 averaged $2.132 per pound, which compares with $2.068 per pound for imports of woolens and worsteds.

TARIFF HISTORY

The tariff act of 1890, paragraph 396, levied a flat rate of 49½ cents per pound and 60 per cent ad valorem on all pile fabrics of wool. Under the act of 1894, paragraph 283, pile fabrics were made dutiable at the same rate as wool cloths; those valued at not over 50 cents per pound were dutiable at 40 per cent ad valorem, and those valued at more than 50 cents were dutiable at 50 per cent ad valorem. Under the act of 1897, paragraph 366, and the act of 1909, paragraph 378, pile fabrics were again dutiable at the same rates as cloths. The latter act, in paragraph 443, specifically stated that plushes, etc., should be classified as manufactures of wool, but manufactures of wool, n. s. p. f., were dutiable in the same paragraph (378) and at the same rates of duty as cloths. The rates on pile fabrics in the acts of 1897 and 1909 were accordingly as follows: On those valued at not more than 40 cents per pound, 33 cents per pound and 50 per cent ad valorem; on those valued at more than 40 but not more than 70 cents per pound, 44 cents per pound and 50 per cent ad valorem; and on those valued at more than 70 cents per pound, 44 cents per pound and 55 per cent ad valorem. Under the act of 1913, paragraph 288, pile fabrics of wool were dutiable at 40 per cent ad valorem and those made of mohair, alpaca, etc., paragraph 309, at 45 per cent ad valorem.

The conditions affecting the adjustment of rates of duty on felt goods, and, to a lesser extent, on blankets, are true of pile fabrics.

These fabrics are seldom made of all wool or mohair; the warp is usually of cotton or other vegetable fiber; therefore they are not entitled to the 5½ cents compensatory allowance on all-wool cloths. The act of 1913, in paragraph 1111, levied a flat rate of 31 cents per pound and 35 per cent ad valorem on all pile fabrics of wool or mohair and on all manufactures made of the same such fabrics.

COMPARATIVE CONDITIONS

England is the main source of our imports of pile fabrics. The factors which govern the manufacture of woolen and worsted cloths have but minor application to pile fabrics. The condition which most adversely affects the American manufacturer is the difference in wage rates. The labor cost per unit of pile fabrics averages higher than for a woolen or worsted cloth of equal value, which is of some advantage to the foreign producer. The construction of pile fabrics admits itself to the production of novelties in a great variety of designs, and this also is of advantage to the foreign manufacturer, as a part of the historical prestige possessed in a degree in the general excellence of foreign fabrics and styles.

Rates of duty

PILE FABRICS OF WOOL OR HAIR, ETC.

Act of—	Par.	Tariff classification or description	Rates of duty
1894	204	On * * * plushes and other pile fabrics, * * * composed wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals the duty per pound shall be four and one-half times the duty imposed by this act on a pound of unwashed wool of the first class, and in addition thereto 40 per centum ad valorem.	49½ cents per pound and 60 per cent ad valorem.
1897	256	* * * and on all manufactures, composed wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals * * * Valued at not over 30 cents per pound Valued at more than 30 cents per pound	40 per cent ad valorem. 50 per cent ad valorem.
1909	378	On * * * all manufactures of every description made wholly or in part of wool, not specially provided for in this act, valued at not more than 40 cents per pound, the duty per pound shall be three times the duty imposed by this act on a pound of unwashed wool of the first class, valued at above 40 cents per pound and not above 70 cents per pound, the duty per pound shall be four times the duty imposed by this act on one pound of unwashed wool of the first class and in addition thereto upon all the foregoing, 50 per centum ad valorem; valued at over 70 cents per pound, the duty per pound shall be four times the duty imposed by this act on one pound of unwashed wool of the first class and 55 per centum ad valorem. Summary: Valued at not more than 40 cents per pound Valued at more than 40 but not more than 70 cents per pound Valued at more than 70 cents per pound	55 cents per pound and 50 per cent ad valorem. 66 cents per pound and 50 per cent ad valorem. 66 cents per pound and 55 per cent ad valorem.

Rates of duty—Continued

Act of—	Par.	Tariff classification or description	Rates of duty
1909	443	Plushes * * * and manufactures thereof, composed of the hair of the camel, goat, alpaca, or any animal, combined with wool, vegetable fiber, or silk, shall be classified and dutiable as manufactures of wool.	
		Summary:	
		Valued at not more than 40 cents per pound	33 cents per pound and 50 per cent ad valorem.
		Valued at more than 40 but not more than 70 cents per pound.	44 cents per pound and 50 per cent ad valorem.
		Valued at more than 70 cents per pound	44 cents per pound and 55 per cent ad valorem.
1913	288	* * * plushes, velvets, and all other pile fabrics, cut or uncut, woven * * *, whether or not the pile covers the entire surface, made wholly or in chief value of wool, and articles made wholly or in chief value of such plushes, velvets, or pile fabrics.	40 per cent ad valorem.
	309	Plushes, velvets, and all other pile fabrics, cut or uncut, woven * * *, whether or not the pile covers the entire surface, made wholly or partly of the hair of the Angora goat, alpaca, or other like animals, and articles made wholly or in chief value of such plushes, velvets, or pile fabrics.	45 per cent ad valorem.
1921	19	Wool and hair of the kind provided for in paragraph 18, when advanced in any manner or by any process of manufacture beyond the washed or scoured condition, and manufactures of which wool or hair of the kind provided for in paragraph 18 is the component material of chief value, 45 cents per pound in addition to the rates of duty imposed thereon by existing law.	
		Summary:	
		Made of wool	45 cents per pound and 40 per cent ad valorem.
		Made of mohair	45 cents per pound and 45 per cent ad valorem.
1922	1110	Pile fabrics, cut or uncut, whether or not the pile covers the whole surface, made wholly or in chief value of wool, and manufactures, in any form, made or cut from such pile fabrics.	40 cents per pound and 50 per cent ad valorem.

COURT AND TREASURY DECISIONS

Pincushions composed of mohair and wool were held to be dutiable at 40 cents per pound and 50 per cent ad valorem under paragraph 1110 rather than as toys under paragraph 1414 of the act of 1922. (Abstract 47289 of 1924.)

Perfume containers in the form of bears made from wool pile fabrics and other material were held dutiable under paragraph 1110 of the act of 1922 at 40 cents per pound and 50 per cent ad valorem and not under paragraph 1119 at 50 per cent ad valorem nor under paragraph 921 at 40 per cent ad valorem. (Abstract 1375 of 1926.)

PART 3

WOOL BLANKETS AND SIMILAR ARTICLES, INCLUDING CARRIAGE AND AUTOMOBILE ROBES AND STEAMER RUGS, MADE OF BLANKETING

TARIFF ACT OF SEPTEMBER 21, 1922

PAR. 1111.—Blankets and similar articles, including carriage and automobile robes and steamer rugs, made of blanketing, wholly or in chief value of wool, not exceeding three yards in length, valued at not more than 50 cents per pound, 18 cents per pound and 30 per centum ad valorem; valued at more than 50 cents but not more than $1 per pound, 27 cents per pound and 32½ per centum ad valorem; valued at more than $1 but not more than $1.50 per pound, 30 cents per pound and 35 per centum ad valorem; valued at more than $1.50 per pound, 37 cents per pound and 40 per centum ad valorem.

DESCRIPTION

A wool blanket is a woven heavy fabric, made of woolen yarn or a mixture of cotton and woolen yarn, fulled or shrunken to a high degree, and gigged or napped until the individual fibers of the component yarn are raised and form a pile-like surface on both sides of the cloth. The fundamental characteristics of a blanket are: The heaviness or thickness of the goods; the closeness or even the obliteration of the weave as a result of the fulling operation; and the high nap on both sides of the fabric. Under this definition there would be embraced under the word "blanket" certain types of carriage and automobile robes and of steamer rugs, and the blanket material, or blanketing, which is woven in the piece and later cut up to make bathrobes, overcoats, and heavy clothing. On the other hand, certain other types of carriage and automobile robes and steamer rugs, and the fabrics known as "machine blankets," used in cushioning the cylinders of calico printing machines, would be excluded under this definition. They have less nap, or they are not so close-woven, heavy, and thick. Many steamer rugs are mere woolen cloths, and the so-called "machine blankets" approach a flannel. The line of demarcation is hard to draw; therefore, paragraph 1111 of the tariff act of 1922 is worded so as to include blankets and similar articles, including carriage and automobile robes and steamer rugs made of blanketing, wholly or in chief value of wool, not exceeding 3 yards in length. Machine blankets, and all other blanketing material exceeding 3 yards in length, are classified as "woven fabrics of wool," according to weight.

DOMESTIC PRODUCTION

Quantity.—The American manufacture of bed blankets did not vary greatly, in quantity of production, in the decades prior to the war. In the period 1889 to 1904 production ranged between 18,000,000 and 20,000,000 square yards; in 1909 there was a decrease to 16,602,502 square yards, while in 1914, probably on account of foreign

military orders in that year, the yardage rose to 28,400,973. In 1919 production amounted to 25,083,256 square yards, but in 1921 it declined to 19,548,688 square yards. The census of 1923 showed a yardage of 32,912,660 and in 1925 production amounted to 34,251,771 square yards. Compared with the census of 1923, all-wool bed blankets declined 7 per cent and cotton-mixed 9 per cent, while the cotton-warp variety increased 24 per cent.

Of horse blankets, production increased between 1889 and 1904 from 5,507,074 to over 7,500,000 square yards, but it, too, fell off in 1909, to a little over 5,000,000 square yards, and rose in 1914 to a little over 8,000,000. In 1919 production amounted to only 1,695,715 and in 1921 to 1,942,492 square yards. In 1923 production rose to 2,475,356 and declined to 1,409,513 square yards in 1925. The production of carriage robes declined from 3,433,712 square yards in 1909 to 500,144 in 1925.

One significant feature of these figures is the drop in 1909, a decline which available data indicate might well have continued in 1914 had the war not intervened. This decline is attributable, so far as bed blankets are concerned, to the competition of all-cotton blankets, mainly of domestic manufacture, as explained more fully below. Another feature is the marked decline in the production of horse blankets and carriage robes between 1914 and 1925 largely due to the increasing replacement of horses and carriages by automobiles.

It is important to note the large proportion of cotton warp and union goods produced. In the pre-war period these two together formed over two-thirds of the production of bed blankets and over nine-tenths of the production of horse blankets. War orders sent the proportions still higher, to 75 and 99 per cent, respectively. In 1925, 68 per cent of the total production of bed blankets was of the cotton warp or union type.

An important additional type of blanket which should be mentioned is that made wholly of cotton. It falls outside the scope of this survey but should be noted as a powerful competitor of the woolen, or chiefly woolen, fabric. Cotton blankets have been manufactured for years, but only within the last ten or fifteen years, since the invention of a new napping machine, have they become sharply competitive with woolen blankets. This machine raises a high thick nap on both sides of the goods, a nap such as had not before been possible to obtain. Such blankets cut severely into the trade in medium to low-grade woolen, or mainly woolen, blankets, so much so that since 1919 the domestic production of cotton blankets, in both quantity and value, exceeded the production of wool and part wool blankets. They suffer from comparison in one respect, namely, that the nap does not hold up well after washing, as does that of good woolen blankets; they are, however, lighter and cheaper.

A comparison of cotton with wool blankets as regards the average ounces per square yard and the average value per square yard, based on the 1925 census figures, is herewith shown:

Blankets	Ounces per square yard	Value per square yard	Blankets	Ounces per square yard	Value per square yard
All wool	10.09	$0.991	Cotton mixed	9.99	$0.640
Cotton warp	9.92	.492	All cotton	7.52	.321

No statistics are available, prior to 1919, for the production of all-cotton blankets. The following table shows the domestic production of all-wool, cotton-warp, cotton-mixed, and all-cotton bed blankets for the census years 1919, 1921, 1923, and 1925:

Domestic production of bed blankets, 1919–1925

Bed blankets	1919	1921	1923	1925
All wool:				
Pounds	4,975,438	5,375,567	7,818,992	6,987,808
Square yards	5,916,197	6,753,613	11,871,816	11,083,923
Value	$6,897,923	$6,505,336	$9,320,873	$10,989,370
Cotton warp:				
Pounds	7,603,761	6,854,942	8,186,606	9,346,463
Square yards	9,244,134	9,295,825	12,186,706	15,070,065
Value	$7,289,253	$6,072,579	$6,138,487	$7,410,534
Cotton mixed:				
Pounds	7,459,554	2,625,633	5,500,253	5,058,469
Square yards	9,922,925	3,499,250	8,854,138	8,097,783
Value	$8,616,905	$2,574,977	$5,286,373	$5,174,672
All cotton:				
Pounds	42,320,816	33,222,299	38,333,215	43,278,256
Square yards	96,620,556	91,519,600	88,060,112	92,077,330
Value	$32,639,927	$21,506,676	$24,712,877	$29,547,532

Table 25, page 140, shows the domestic production of bed blankets, horse blankets, and carriage robes, wholly or in chief value of wool, for the census years 1909 to 1925, inclusive.

Materials used.—Yarns employed for weaving wool blankets are wool, merino,[1] and cotton. The latter is used only for the warp, often to give strength to an otherwise flimsy fabric. Woolen yarns made wholly of new wool are employed exclusively only in the manufacture of the best blankets. Few mills confine themselves to new wool, only the small mills in rural communities, especially those near the chief wool-raising regions. The larger mills employ, in addition, cotton, wool noils, waste, recovered wool fiber, and sometimes cattle hair or other substitutes. Most of the woolen yarns used in blankets have an admixture of one or more of these other materials, and some contain no new wool at all. The poorer grades are used mainly as filling in a blanket which has a cotton warp.

An inquiry made in some detail by the Tariff Commission as to the proportions of the several raw materials used in the manufacture of wool blankets showed that in many mills new wool constituted a small percentage of the total. For instance, a mill making a wide variety of products—bed and horse blankets and carriage robes, all wool, merino, and cotton warp—used in a year of normal business 31 per cent new wool, 30 per cent noils and wool waste, 15 per cent recovered wool fiber, 19 per cent cotton, and 5 per cent purchased cotton yarn. Two other mills, making cotton-warp blankets, used new wool only to the extent of 15 per cent of their total raw materials. A manufacturer of horse blankets reported that he used no new wool, only cattle and other animal hair, recovered wool fiber, and cotton yarn.

The manufacture of wool blankets is confined almost entirely to the woolen branch of the industry. The materials used in blanket

[1] Yarn made of wool and cotton mixed.

manufacture are not separately stated by the census but are included with the other materials used by the woolen mills, shown in Table 3, page 112.

METHODS OF PRODUCTION

The choice and the blending of the raw materials are important in the manufacture of blankets. A good quality of material is necessary to secure a good fabric, but a careful adjustment of the mixture sometimes permits the use of cheap materials in the manufacture of a well-wearing blanket. Skill and long experience are necessary in the preparation of an economical yet satisfactory "mix."

Manufacturing operations are similar to those used in the manufacture of other heavy woolen fabrics and do not present any peculiar difficulties. The designs used in the past were usually simple and did not vary from season to season as do those for cloth. In recent years, however, novelty blankets have been more in demand and designing has become a factor of more importance. Since weight is desirable in blankets, coarse yarns only are required. These coarse yarns, loosely twisted, are turned out cheaply and efficiently by American mills. Only the simplest weaves, either the plain or twill, are customary, since the weave structure is bound to be concealed or obliterated in the finishing process.

The looms used in weaving blankets are similar to those used in the weaving of woolens except that they are wider—usually more than 100 inches reed space. Jacquard looms are necessary in the production of blankets made with fancy borders. During the war carpet looms were used for weaving military blankets.

The finishing processes, chief among which are fulling and gigging, are of primary importance in the manufacture of blankets. Fulling is a process of shrinking and felting the fabric, giving it greater thickness and more weight to a given area. It is accomplished in large, closed boxes within which the fabric is moistened with soap and water and passed between rollers or under a huge hammer. This operation consolidates the fabric, and, if carried to a certain point, bursts the constituent yarns and destroys the weave structure. It decreases the area of the cloth, usually by 20 to 25 per cent. After it is fulled, the fabric is passed through the gigging machine, in which the individual fibers are raised by means of fine teeth on cylinders, until a high thick nap on both sides of the fabric is secured. In carriage and automobile robes, this operation raises the fibers of the cattle hair in the filling yarn into the plushlike nap which characterizes these goods.

GEOGRAPHIC DISTRIBUTION

Blanket manufacture is one of the most widely distributed branches of the American wool industry. It was undertaken early by frontier communities, because of the urgent need for its products and because of the supply of wool usually available. The large-scale blanket manufacturers are now located in Massachusetts and Pennsylvania, although Ohio, Indiana, and California also produce considerable quantities in fair-sized mills. With the march of the frontier across the continent, blanket manufacture was established in most States. Small mills are scattered from North Carolina to Washington. These small mills still exist, either through availability of wool, as in far Western States, or

[illegible] over 4 ounces per square yard, [illegible] value. These figures would indicate [illegible] was being imported under the act of [illegible] at more than $1.50 per pound, however, [illegible] pounds in 1923, 45,082 pounds in 1924, [illegible]. These quantities were in excess of the [illegible] imports prior to the war. In 1923 there were [illegible] at $14,392; in 1924, 37,039 pounds, valued at [illegible] 12,484 pounds, valued at $5,471, brought in [illegible] not more than 50 cents per pound. These were [illegible] surplus Army stocks that were sold abroad at less [illegible].

[illegible] made at the appraisers' stores in New York dis- [illegible] that large quantities of low-priced blankets were being [illegible] under paragraph 1430 of the tariff act of 1922, dutiable at [illegible] ad valorem. Imports of wool embroideries and embroid- [illegible] from September 22, 1922, to December 31, 1926, were [illegible]:

Year	Quantity	Value	Unit value	Rate of duty
	Pounds			*Per cent*
[illegible]	73,978	$332,330	$4.358	75
[illegible]	127,885	514,713	4.025	75
[illegible]	1,291,426	753,611	.584	75
[illegible]	734,219	331,229	.451	75
[illegible]	159,224	45,185	.284	75

[1] Sept. 22 to Dec. 31, 1922. [2] Includes embroidered blankets only.

Paragraph 1430 of the tariff act of 1922 includes "all fabrics and articles embroidered in any manner by hand or machinery, whether with a plain or fancy initial, monogram, or otherwise." It will be noted that the average value per pound of wool embroideries and embroidered articles in 1923 was $4.025; in 1924, $0.584; and in 1925, $0.451. This increase in quantity and decrease in value per unit of the 1924 and 1925 imports was caused by the embroidering of an initial on one corner of low-priced blankets and entering them as "articles embroidered" dutiable at 75 per cent ad valorem.

The chart on page 103 is a graphic illustration of the equivalent ad valorem rates of duty levied on blankets in paragraph 1111 and of the ad valorem rate of duty levied on embroidered articles in paragraph 1430. This shows that on wool blankets valued at less than 40 cents per pound, and on wool blankets valued at more than 50 and not more than 63.53 cents per pound, it will pay the importer to embroider an initial on the blanket in order to get the embroidered-article rate of 75 per cent ad valorem. At any other value the equivalent ad valorem rate levied on blankets is lower than the rate levied on embroidered articles. The question of undervaluation has been investigated by agents of the Treasury Department, who report that the appraised value is in accordance with law.

The tariff acts of 1890 and 1913 related to "blankets" without specification as to length. Under the acts of 1894, 1897, and 1909 blankets over 3 yards in length were dutiable as cloths. Table 26, page 140, shows the ratio of imports of blankets not over 3 yards in

length to domestic production in the census years 1889 to 1925 and the ratio of exports to production in 1919 and 1921. Table 27, page 141 shows imports of blankets not over 3 yards in length from October 6, 1890, to December 31, 1925. Table 15d, page 132, shows imports of blankets over 3 yards in length, and therefore dutiable as cloths, recorded during the period of the tariff acts of 1894, 1897, and 1909.

Sources of imports.—Imports of wool blankets by countries are not shown in official trade returns of the United States. Interviews with the trade and with customs officials, supplemented by an analysis of invoices at New York by a representative of the Tariff Commission, disclose, however, that the leading sources of our imports are the

Cents per Pound

United Kingdom, Czechoslovakia, Austria, and Germany—about in the order given.

Nature of imports.—Prior to the year 1923 imports of wool blankets consisted largely of high-grade and novelty goods. It is true, as stated above, that lower grade blankets were imported following the reduction of the duty in 1913, and that even the upward trend in grade resulting from the enactment of the emergency law has been broken by an occasional shipment of the cheaper variety. It was found upon inquiry that no imports whatever of horse blankets have come into the port of New York in recent years, and that practically all imports (aside from steamer rugs, automobile robes, etc.) consisted

of high-grade bed blankets. Most of these blankets are wholly or very largely pure wool; many of them are woven as double cloth, with a different color on each side. Those imported from Czechoslovakia are mainly of this type of luxury goods.

Considerable quantities of steamer rugs, automobile robes, etc., are also brought in. Most of them come from the United Kingdom, perhaps the largest portion from Ireland, but some also from England. In general importers make no distinction between steamer rugs and automobile or carriage robes. Perhaps the most obvious difference is the finishing of the edges. The greater number of steamer rugs are made with fringed edges, whereas the automobile robes are usually bound on all sides and can be utilized as bed blankets. Indeed, both types of goods are put to widely varying uses. Many rugs, particularly the lighter-weight ones, are used for women's capes, shawls, and coats. Some are made up in solid colors; many of them in plaids or with plaid backs. As a rule the plaid-back goods are sold at a higher price. Importers state that in general their goods possess an advantage in coloring and range and that there is direct competition with domestic goods only in the lower and medium grades.

COMPETITIVE CONDITIONS

American manufacturers have several advantages in the production of blankets in competition with foreigners.

(*a*) The manufacturing problem is simple. The material is spun into low-count yarn and the weaving is not intricate. The finishing, while important for the development of quality, is not a difficult operation. In none of these phases is the American producer under a handicap, except in making the finest goods. Indeed, it is for the most part the type of work for which our factories are particularly well fitted.

(*b*) Comparatively little skilled labor is required and still less of that long-experienced labor required for the production of high-grade cloths and dress goods.

(*c*) There is no problem of foreign styles or prejudice in favor of foreign goods such as affects the cloth and dress goods trade.

(*d*) Production is well dispersed. The smaller mills, scattered through the States, many of which are not normally of the wool manufacturing group, and possessing such advantages as propinquity to wool supplies or special favor in a local market, are not much exposed to foreign competition. Only those mills of the Eastern States which do a large-scale business are so exposed, and they are the more efficient producers.

The conclusion seems warranted, therefore, that the danger of an inundation of foreign blankets under the tariff of 1922 is not great. The increase in quantity and value of blankets imported in 1923 was only a temporary problem, due largely to the sale of excess army stocks that sold far below cost.

Certain specially high-grade articles will probably continue to come in, goods in which longer and wider experience in the selection and blending of raw materials, and greater care and labor in the production of a superior finish give the foreigner some advantage.

Under the present tariff law greater competition arises from the domestic all-cotton blanket than from the foreign wool blanket.

The cotton blanket has been a severe competitor in the past and may continue to be. As already shown, the domestic production of all-cotton blankets exceeded that of woolen blankets in 1919, 1921, 1923, and 1925 not only in quantity but in value. With the increasing use of furnaces for heating houses, warmth has been a less important factor, while the importance of lightness and cheapness has loomed larger. Even as to warmth, the difference between wool and cotton blankets is greatly exaggerated.

TARIFF HISTORY

The acts of 1890, 1897, 1909, and 1922 provided compound duties for blankets. In all four acts the specific portion of the rate was intended as a compensatory duty for that levied on raw wool and was based thereon. The act of 1890 divided blankets into four classes, according to value, and provided specific rates of 16½, 22, 33, and 38½ cents per pound, respectively, and additional ad valorem duties of 30 per cent for the first class, 35 per cent for the second and third, and 40 for the last. The duties of the acts of 1897 and 1909 were identical; the three classes provided for bore specific duties of 22, 33, and 33 cents, and additional ad valorem rates of 30, 35, and 40 per cent, respectively. The act of 1922 classified blankets and similar articles, including carriage and automobile robes and steamer rugs made of blanketing, into four classes, according to value, and provided specific rates of 18, 27, 30, and 37 cents per pound, respectively, and additional ad valorem duties of 30 per cent for the first class, 32½ for the second, 35 per cent for the third, and 40 per cent for the last. In the acts of 1894, 1909, and 1922 blankets over 3 yards in length did not fall under these duties but were provided for as cloths at higher rates of duty.

The act of 1894 provided ad valorem rates of 25, 30, and 35 per cent on wool blankets, classified according to value. In 1913 a single ad valorem rate of 25 per cent (par. 289) was enacted for wool blankets without regard to length or value; in 1921 an additional duty of 45 cents per pound was imposed upon blankets (as upon other wool manufactures).

Rates of duty

WOOL BLANKETS

Act of—	Par.	Tariff classification or description	Rates of duty
1890	393	On blankets, * * * composed wholly or in part of wool, the hair of the camel, goat, alpaca, or other animals, valued at not more than 30 cents per pound, the duty per pound shall be the same as the duty imposed by this act on one pound and one-half of unwashed wool of the first class, and in addition thereto 30 per centum ad valorem; valued at more than 30 and not more than 40 cents per pound, the duty per pound shall be twice the duty imposed by this act on a pound of unwashed wool of the first class; valued at more than 40 cents and not more than 50 cents per pound, the duty per pound shall be three times the duty imposed by this act on a pound of unwashed wool of the first class; and in addition thereto * * * 35 per centum ad valorem. On blankets * * * composed wholly or in part of wool, the hair of the camel, goat, alpaca, or other animal, valued at more than 50 cents per pound, the duty per pound shall be three and a half times the duty imposed by this act on a pound of unwashed wool of the first class, and in addition thereto 40 per centum ad valorem.	

Rates of duty—Continued

WOOL BLANKETS—Continued

Act of—	Par.	Tariff classification or description	Rates of duty
1890	393	Summary:	
		Valued at not more than 30 cents per pound	16½ cents per pound and 30 per cent ad valorem.
		Valued at more than 30 but not more than 40 cents per pound.	22 cents per pound and 35 per cent ad valorem.
		Valued at more than 40 but not more than 50 cents per pound.	33 cents per pound and 35 per cent ad valorem.
		Valued at more than 50 cents per pound	38½ cents per pound and 40 per cent ad valorem.
1894	282	On blankets, * * * composed wholly or in part of wool, the hair of the camel, goat, alpaca, or other animals:	
		Valued at not more than 30 cents per pound	25 per cent ad valorem.
		Valued at more than 30 and not more than 40 cents per pound.	30 per cent ad valorem.
		Valued at more than 40 cents per pound	35 per cent ad valorem.
		Provided, That on blankets over three yards in length the same duties shall be paid as on woolen and worsted cloths, * * *.	
1897	367	On blankets, * * *, composed wholly or in part of wool, valued at not more than 40 cents per pound, the duty per pound shall be the same as the duty imposed by this Act on two pounds of unwashed wool of the first class, and in addition thereto 30 per centum ad valorem; valued at more than 40 cents and not more than 50 cents per pound, the duty per pound shall be three times the duty imposed by this Act on one pound of unwashed wool of the first class, and in addition thereto 35 per centum ad valorem. On blankets composed wholly or in part of wool, valued at more than 50 cents per pound, the duty per pound shall be three times the duty imposed by this Act on one pound of unwashed wool of the first class, and in addition thereto 40 per centum ad valorem. * * *: *Provided*, That on blankets over three yards in length the same duties shall be paid as on cloths.	
		Summary:	
		Valued at not more than 40 cents per pound	22 cents per pound and 30 per cent ad valorem.
		Valued at more than 40 but not more than 50 cents per pound.	33 cents per pound and 35 per cent ad valorem.
		Valued at more than 50 cents per pound	33 cents per pound and 40 per cent ad valorem.
1909	379	(Wording and rates same as in par. 367 of the act of 1897.)	
1913	289	Blankets * * * composed wholly or in chief value of wool.	25 per cent ad valorem.
1921	19	Wool and hair of the kind provided for in paragraph 18, when advanced in any manner or by any process of manufacture beyond the washed or scoured condition, and manufactures of which wool or hair of the kind provided for in paragraph 18 is the component material of chief value, 45 cents per pound in addition to the rates of duty imposed thereon by existing law.	45 cents per pound and 25 per cent ad valorem.
1922	1111	Blankets and similar articles, including carriage and automobile robes and steamer rugs, made of blanketing, wholly or in chief value of wool, not exceeding three yards in length.	
		Valued at not more than 50 cents per pound	18 cents per pound and 30 per cent ad valorem.
		Valued at more than 50 cents but not more than $1 per pound.	27 cents per pound and 32½ per cent ad valorem.
		Valued at more than $1 but not more than $1.50 per pound.	30 cents per pound and 35 per cent ad valorem.
		Valued at more than $1.50 per pound	37 cents per pound and 40 per cent ad valorem.

Court and Treasury Decisions

WOOL BLANKETS AND SIMILAR ARTICLES

Lap robes, steamer rugs, and auto rugs, of mixed colors, some with fringed ends and some with bound edges, used as coverings at seacoast resorts, in automobiles and carriages, on couches, and in hospitals and sanitariums, were not dutiable as blankets under paragraph 289 of the act of 1913, but as woolen manufactures under para-

graph 288. The word "blanket" is used as meaning a heavy cover, with a thick, soft nap on both sides, for a bed or a horse. (Riley *v.* United States, 8 Ct. Cust. Appls. 116 of 1917.) Mexican woolen blankets called "Zerapes," which, although fancy and decorative, are used principally as couch and bed covers and by Indians as garments, were held properly classified as blankets under paragraph 289 of the act of 1913 and not as manufactures of wool under paragraph 288. (G. A. 8113, T. D. 37434, of 1917; but see Abstract 43437 of 1919, holding the evidence insufficient to sustain the importer's claim in the latter case.)

Automobile robes or steamer rug composed of a heavy loosely woven fabric having a nap and conforming to the definition of blanketing were held on the record properly classified under paragraph 1111 of the act of 1922, and not as manufactures of wool under paragraph 1119. (Abstract 47030 of 1924.)

Blanketing material about 5 yards long which might be cut into two blankets, but which as imported consisted of one blanket without any line of demarcation to separate it into two, was held to be one blanket and not two blankets, and dutiable as manufactures of wool under paragraph 1119 of the act of 1922 and not under paragraph 1111 nor under paragraphs 1108 or 1109, notwithstanding that 50 per cent of these articles are after importation cut up and made into cloths. (Abstract 51381 of 1926; appeal pending in Court of Customs Appeals: T. D. 41521.)

All-wool worsted—					
Pounds	3,348,715	4,493,333	1,492,918	2,964,328	[2]
Square yards	6,064,227	8,538,766	3,531,760	4,348,267	2,508,763
Value	$11,028,565	$13,482,338	$4,313,566	$9,172,426	$2,137,030

[1] Not including woven upholstery goods. [2] Not reported.

TABLE 4.—*Quantity and value of woven fabrics produced by the woolen-goods industry 1914–1925*—Continued

Class	1925	1923	1921	1919	1914
Woven goods—Continued.					
Suitings, dress goods, overcoatings and cloakings—Continued.					
Wool and cotton mixed—					
Pounds	12,945,700	16,834,315	10,462,381	17,643,021	(1)
Square yards	20,189,956	22,739,313	14,434,019	22,046,401	28,549,109
Value	$17,705,952	$22,922,455	$11,124,357	$23,507,042	$10,243,869
Cotton-warp woolen—					
Pounds	40,143,516	37,914,008	23,912,462	22,738,473	(1)
Square yards	60,892,042	61,136,209	43,585,942	37,100,656	48,284,320
Value	$39,963,304	$35,379,558	$21,586,603	$31,508,800	$11,878,272
Cotton-warp worsted—					
Pounds	345,068	480,700	65,759	1,214,980	(1)
Square yards	537,671	1,058,269	111,079	2,659,716	2,696,072
Value	$689,342	$761,642	$48,800	$2,046,678	$665,342
Flannels for underwear, all wool:					
Pounds	172,234	1,386,689	853,195	825,886	(1)
Square yards	672,067	2,842,795	1,846,965	1,733,250	2,176,264
Value	$299,385	$2,120,082	$1,319,579	$1,860,585	$880,494
Flannels for underwear, cotton mixed:					
Pounds	284,636	1,149,604	683,937	2,610,419	(1)
Square yards	998,736	3,777,337	2,624,981	6,497,990	4,995,575
Value	$649,002	$1,635,735	$1,191,384	$5,205,330	$1,089,661
Domett flannels and shirtings:					
Pounds	2,907,735	2,855,576	(2)	11,409,777	(1)
Square yards	7,205,582	6,154,684	(2)	21,183,496	16,092,266
Value	$3,439,996	$4,595,279	(2)	$10,596,709	$2,814,054
Satinets and linseys:					
Pounds	7,826,186	3,833,126	2,350,709	3,299,931	(1)
Square yards	11,877,015	6,107,064	4,523,398	4,637,678	8,415,079
Value	$4,244,228	$2,278,151	$1,524,882	$3,517,427	$1,535,291
Blankets, all wool:					
Pounds	(2)	(2)	(2)	4,955,831	(1)
Square yards	(2)	(2)	(2)	5,896,557	5,786,215
Value	(2)	(2)	(2)	$6,837,897	$3,843,893
Blankets, cotton mixed:					
Pounds	5,058,469	(2)	(2)	7,459,554	(1)
Square yards	8,097,783	(2)	(2)	9,922,925	3,937,463
Value	$5,174,672	(2)	(2)	$8,616,905	$2,067,934
Blankets, cotton warp:					
Pounds	(2)	(2)	6,054,942	7,603,761	(1)
Square yards	(2)	(2)	9,295,825	9,244,134	17,973,821
Value	(2)	(2)	$6,072,579	$7,289,253	$3,010,070
Horse blankets:					
Pounds	(2)	2,497,525	(2)	1,664,039	(1)
Square yards	(2)	2,475,356	(2)	1,695,715	8,164,672
Value	(2)	$1,338,551	(2)	$1,606,417	$2,017,782
Carriage robes:					
Pounds	(2)	(2)	(2)	1,754,951	(1)
Square yards	(2)	(2)	(2)	1,297,439	1,768,865
Value	(2)	(2)	(2)	$1,908,343	$1,233,555
Woven shawls:					
Pounds	182,326	(2)	(2)	590,667	(1)
Square yards	250,256	(2)	(2)	868,971	124,486
Value	$351,646	(2)	(2)	$854,041	$60,365
All other woolen and worsted woven goods:					
Pounds	6,418,011	10,844,131	5,647,419	11,894,332	(1)
Square yards	11,208,848	14,097,118	6,969,385	4,964,108	2,869,367
Value	$12,255,967	$14,328,542	$9,639,577	$6,665,741	$756,112

[1] Not reported.

[2] Included in "all other woolen and worsted woven goods."

TOTAL OF TABLES 14 AND 15

TABLE 13.—*Total products and materials—Imports for consumption—Revenue 1891–1926*

[Compiled according to tariff acts by U. S. Tariff Commission]

Fiscal year (unless otherwise stated)	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate
	Pounds				*Per cent*
1891 Oct. 6, 1890, to June 30, 1891		$15,494,912	$14,794,599		95.48
1892		29,456,413	26,975,961		91.57
1893		30,705,213	31,154,735		101.46
1894		15,776,191	15,814,565		100.23
1895 July 1 to Dec. 31, 1894		5,672,621	5,151,950		90.82
Total 1,548 days, act of 1890		96,255,230	93,891,879		97.54
Annual average act of 1890		22,778,445	22,396,735		98.32
1895 Jan. 1 to June 30, 1895		25,251,088	12,399,087		49.10
1896		39,662,326	19,230,172		48.47
1897		35,496,933	18,698,106		52.67
1898 July 1 to July 24, 1897		2,682,515	1,230,615		45.87
Total 1,306 days, act of 1894		103,615,279	51,695,924		49.89
Annual average act of 1894		41,341,436	20,136,973		48.71
1898 July 25, 1897, to June 30, 1898		6,732,812	6,962,709		103.42
1899		9,578,689	10,075,757		105.19
1900		10,867,851	10,716,528		98.61
1901		9,577,064	9,612,557		100.37
1902		11,094,982	11,183,305		100.80
1903		12,309,575	12,854,623		104.43
1904		12,230,084	12,364,553		101.10
1905		12,744,089	12,750,607		100.05
1906		14,975,765	15,145,640		101.13
1907		15,185,148	15,127,882		99.62
1908		13,812,056	13,731,965		99.42
1909		11,900,906	11,976,832		100.64
1910 July 1 to Aug. 5, 1909		1,507,984	1,517,974		100.66
Total 4,394 days, act of 1897		142,716,118	143,430,725		100.50
Annual average act of 1897		11,855,116	11,913,649		100.49
1910 (Aug. 6, 1909, to June 30, 1910		13,942,933	14,034,433		100.66
1911		11,685,128	11,584,280		99.14
1912		8,184,780	7,802,951		95.33
1913		7,780,572	7,494,605		96.32
1914 July 1 to Dec. 31, 1913		3,722,158	3,486,916		93.67
Total 1,609 days, act of 1909		45,315,550	44,412,985		98.01
Annual average act of 1909		10,279,852	10,074,596		98.01
1914 (Jan. 1 to June 30, 1914)	16,576,336	16,371,340	5,765,729	$0.988	35.22
1915	20,136,348	18,673,327	6,593,022	.928	35.30
1916	9,993,433	10,432,675	3,706,539	1.044	35.53
1917	8,259,743	10,431,263	3,703,224	1.263	35.50
1918	3,672,601	6,253,946	2,217,356	1.703	35.46
1919 (July 1 to Dec. 31, 1918)	1,378,925	2,823,956	998,702	2.048	35.37
1919 (calendar year	2,710,108	7,105,907	2,498,637	2.622	35.17
1920 (calendar year)	7,028,342	18,458,498	6,474,928	2.626	35.08
1921 (calendar year	[2] 8,415,933	16,760,539	7,419,022	1.992	44.26
1922 (Jan. 1 to Sept. 21, 1922)	[3] 6,886,080	12,476,067	7,448,774	1.812	59.70
Total (3,196 days, act of 1913)	84,989,719	119,789,433	46,830,178	1.409	39.09
Annual average (act of 1913)	9,736,739	13,723,528	5,363,894	1.409	39.09
1922 (Sept. 22 to Dec. 31, 1922)	1,787,001	3,509,301	2,535,030	1.964	72.24
1923 (calendar year)	10,766,496	20,127,887	14,757,796	1.869	73.32
1924 (calendar year)	11,350,314	20,481,672	15,059,603	1.805	73.53
1925 (calendar year)	10,649,145	22,022,620	15,593,063	2.068	70.80
1926 (calendar year)	10,468,151	21,180,044	15,000,238	2.023	71.25

[1] Total woven fabrics of wool, mohair, alpaca, etc. (including those weighing not over 4 ounces per square yard and those weighing over 4 ounces per square yard) such as are dutiable under pars. 1108 and 1109 of the tariff act of 1922.

[2] Includes, under the emergency tariff act, 3,420,865 pounds, valued at $6,648,942, paying, on the basis of 45 cents a pound in addition to the ad valorem rates; total duty of $3,871,521, equivalent to 58.23 per cent ad valorem.

[3] Includes 6,823,850 pounds, valued at $12,467,492, subject to the emergency tariff act surtax of 45 cents a pound and paying total duty of $7,445,346, equivalent to 59.72 per cent ad valorem.

TABLE 14.—*Total woven fabrics of wool, mohair, alpaca, etc., weighing not over 4 ounces per square yard* [1]*—Imports for consumption—Revenue, 1891–1926*

[Compiled according to tariff acts by U. S. Tariff Commission]

Fiscal year (unless otherwise stated)	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate

[1] Cloths, weighing over 4 ounces per square yard, wholly or in part of wool, mohair, alpaca, etc. Imports shown for act of 1913 do not include cloths of mohair (see Table 14d).

[2] Includes, under the emergency tariff act, 4,448,205 square yards (2,824,774 pounds) valued at $5,430,859, paying on the basis of 45 cents a pound in addition to 35 per cent ad valorem, total duty of $3,171,949.

[3] Includes 8,282,360 square yards (5,664,994 pounds), valued at $10,163,723, subject to emergency tariff act surtax of 45 cents a pound and paying total duty of $6,106,550.

[4] Woven fabrics, weighing more than 4 ounces per square yard, wholly or in chief value of wool, mohair, alpaca, etc.

TABLE 15B.—*Dress goods, etc., weighing over 4 ounces per square yard, of wool, mohair, alpaca, etc.*[1]*—Imports for consumption—Revenue, 1891–1914*

Fiscal year (unless otherwise stated)	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate

Annual average (act of 1909)	1,504,312	1,411,049	1,431,372	.938	101.44

[1] Recorded separately under the acts of 1890, 1897, and 1909 only. Separate record under the acts of 1897 and 1909 was due to the provision that on dress goods, coat linings, Italian cloths, bunting, and goods of similar description or character, composed wholly or in part of wool, mohair, alpaca, etc., weighing over 4 ounces per square yard the rates of duty should be the same as those imposed on cloths.

TABLE 15c.—*Dress goods, etc., weighing over 4 ounces per square yard, of wool, mohair, alpaca, etc., with cotton warp*[1]*—Imports for consumption—Revenue, 1891–1914*

[1] Recorded separately under the acts of 1890, 1897, and 1909 only. Separate record under the act of 1897 was due to the provision that on dress goods, coat linings, Italian cloths, and goods of similar description or character, of which the warp consisted wholly of cotton or other vegetable material with the remainder of the fabric composed wholly or in part of wool, mohair, alpaca, etc., weighing over four ounces per square yard, the rates of duty should be the same as those imposed on cloths; and under the act of 1909, to the provision that on such heavyweight cotton-warp dress goods, etc., the rates of duty should be 5 per cent less than those imposed on cloths.

[1] The words "for underwear" were used in listing imports under the acts of 1890, 1894, 1897, and 1909. Imports shown for the acts of 1897 and 1909 include all flannels except those recorded in square yards and at the rates of duty provided for dress goods weighing not over 4 ounces per square yard. (For imports of lightweight wool flannels see Table 14e). Imports shown for act of 1913 are the inclusive totals for "flannels composed wholly or in chief value of wool." Imports of wool flannels under the act of 1922 are not separately recorded but are dutiable as woven fabrics of wool, under paragraphs 1108 or 1109, according to weight.

[2] Includes, under the emergency tariff act, 107,470 pounds, valued at $234,946, paying, on the basis of 45 cents a pound in addition to the ad valorem rates, total duty of $118,845.

[3] Includes 220,441 pounds, valued at $437,287, subject to emergency tariff act surtax of 45 cents a pound and paying total duty of $230,377.

TABLE 16.—*Woolens and worsteds—Relation of imports and exports to production in census years 1889–1925*

Census year	Value of domestic production [1]	Value of imports for consumption [2]	Value of domestic exports [3]	Relation of imports to domestic production	Relation of exports to domestic production
				Per cent	*Per cent*
1889	$158,405,083	$30,370,494	(4)	19.17	----------
1899	174,969,962	9,879,699	(4)	5.65	----------
1904	225,047,678	12,230,034	(4)	5.43	----------
1909	285,754,088	11,900,906	(4)	4.16	----------
1914	256,097,020	20,093,498	(4)	7.85	----------
1919	712,106,911	7,105,507	$19,799,723	1.00	2.78
1921	533,315,153	16,760,839	4,040,988	3.14	.76
1923	701,697,838	20,127,887	2,346,953	2.87	.33
1925	613,719,460	22,022,680	1,132,971	3.59	.18

[1] Total of (a) suitings, dress goods, overcoatings, and cloakings; (b) flannels for underwear and domett flannels and shirtings; (c) satinets and linseys; and (d) all other woolen and worsted woven goods, as shown in more detail in Tables 4 and 8. Data here shown do not include blankets, carriage robes, and shawls, which are separately provided for in the tariff act as articles rather than piece goods, and do not include upholstery goods, which are mainly pile fabrics and therefore separately provided for.

[2] Woolens and worsteds of the character provided for in paragraphs 1108 and 1109 of the tariff act of 1922. For details see Table 13.

[3] Recorded as "cloths and dress goods."

[4] Not recorded.

1920 (calendar year)		61,114	25,721		42.09
1921 (calendar year)		[2]38,156	17,869		46.83
1922 (Jan. 1 to Sept. 21, 1922)		[3]36,870	20,147		54.64
Total (3,186 days, act of 1913)		410,464	180,023		43.86
Annual average (act of 1913)		47,024	20,624		43.86
1922 (Sept. 22 to Dec. 31, 1922)	11,037	21,997	15,413	1.993	70.07
1923 (calendar year)	101,013	180,822	130,816	1.790	72.34
1924 (calendar year)	31,051	75,761	50,301	2.440	66.39
1925 (calendar year)	34,683	90,506	59,126	2.610	65.33
1926 (calendar year)	53,454	118,938	80,851	2.225	67.98

[1] Not separately recorded prior to Jan. 1, 1914.
[2] Includes, under the emergency tariff act, 3,690 pounds, valued at $12,167, paying, on the basis of 45 cents a pound in addition to the ad valorem rates, total duty of $6,626.
[3] Includes 8,609 pounds, valued at $18,105, subject to emergency tariff act surtax of 45 cents a pound and paying total duty of $11,703.

TABLE 25.—*Domestic production of wool blankets and carriage robes, 1914–1925*

Class	1925	1923	1921	1919	1914
Blankets:					
All-wool—					
Pounds	6,987,808	7,818,992	5,375,567	4,975,438	
Square yards	11,083,923	11,871,816	6,753,613	5,916,197	6,489,689
Value	$10,989,370	$9,320,873	$6,505,336	$6,897,923	$4,186,754
Cotton-mixed—					
Pounds	5,058,469	5,500,253	2,625,633	7,459,554	
Square yards	8,097,783	8,854,138	3,499,250	9,922,925	3,937,463
Value	$5,174,672	$5,286,373	$2,574,977	$8,616,905	$2,607,934
Cotton-warp—					
Pounds	9,346,463	8,186,606	6,854,942	7,603,761	
Square yards	15,070,065	12,186,706	9,295,825	9,244,134	17,973,821
Value	$7,410,534	$6,138,487	$6,072,579	$7,289,253	$3,010,070
Horse blankets:					
Pounds	1,578,780	2,497,525	2,279,625	1,664,039	
Square yards	1,409,513	2,475,356	1,942,492	1,695,715	8,164,672
Value	$786,560	$1,338,551	$1,173,058	$1,606,417	$2,017,782
Carriage robes:					
Pounds	799,622	1,128,053	388,525	1,754,951	
Square yards	500,144	535,631	268,102	1,297,439	1,768,865
Value	$668,084	$619,126	$473,386	$1,908,345	$1,233,555

TABLE 26.—*Wool blankets not over 3 yards in length—Relation of imports and exports to production in census years 1899–1925*

Census year	Value of domestic production [1]	Value of imports for consumption	Value of domestic exports [2]	Relation of imports to domestic production	Relation of exports to domestic production
				Per cent	*Per cent*
1899	$7,826,179	$15,295	([3])	0.20	
1904	9,131,988	20,269	([3])	.22	
1909	10,288,973	20,972	([3])	.20	
1914	13,056,095	67,811	([3])	.52	
1919	26,318,843	38,263	$823,544	.15	3.13
1921	16,799,336	71,930	257,041	.43	1.53
1923	22,703,410	[4]243,097	([3])	1.07	
1925	25,029,220	[4]364,979	([3])	1.46	

[1] Includes all-wool, cotton-mixed, and cotton-warp bed blankets, horse blankets, and carriage robes.
[2] Recorded as "blankets" without specification as to length.
[3] Not separately recorded.
[4] Includes carriage and automobile robes and steamer rugs made of blanketing.

TABLE 27.—*Wool blankets not over 3 yards in length* [1]*—Imports for consumption—Revenue, 1891–1926*

[Compiled according to tariff acts by U. S. Tariff Commission]

Fiscal year (unless otherwise stated)	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate
	Pounds				*Per cent*
1891 (Oct. 6, 1890, to June 30, 1891)	32,018	$23,439	$19,863	$0.732	84.74

1924 (calendar year)	224,688	241,931	150,287	1.077	62.12
1925 (calendar year)	296,050	364,979	220,702	1.233	60.47
1926 (calendar year)	[4] 417,770	474,341	289,322	1.135	60.99

[1] Imports shown for the acts of 1890 and 1913 relate to "blankets" without specification as to length. Under the acts of 1894, 1897, and 1909, blankets over 3 yards in length were dutiable as cloths (see Table 15–d) and are excluded from the data here shown. Imports shown for act of 1922 relate to "blankets and similar articles of wool, including carriage and automobile robes and steamer rugs made of blanketing, not exceeding 3 yards in length."

[3] Includes, under the emergency tariff act, 27,830 pounds, valued at $44,174, paying, on the basis of 45 cents a pound in addition to 25 per cent ad valorem, total duty of $23,567.

[3] Includes 29,691 pounds, valued at $55,391, subject to emergency tariff act surtax of 45 cents a pound and paying total duty of $27,209.

[4] In addition, imports of embroidered wool blankets amounted to 159,224 pounds, valued at $45,185, dutiable at 75 per cent ad valorem.

PREFACE

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission. These surveys have been prepared in accordance with the provisions of the tariff act in force at the time of their preparation and cover all the articles and commodities provided for in the act of 1922 and others not specially provided for.

In some cases two or more paragraphs have been combined in one survey. In doing this, industrial relationship of the articles has been kept in view. Where an article or a commodity has been treated under a preceding paragraph, reference to this fact is made. Where one grade of an article or commodity is dutiable and another grade of the same article or commodity is on the free list, the entire treatment is carried out under the dutiable paragraph.

A separate pamphlet listing the principal subjects investigated and reported upon has been published. It contains:

(1) An alphabetical index of the articles and commodities provided for in the tariff act of 1922, showing the paragraph in the act in which the article or commodity is provided for and, if discussed under a different paragraph, the number of such paragraph.

(2) The number of the survey in which the article or commodity is discussed.

Special and miscellaneous reports, which are unnumbered, are also included in the index.

Thus, by use of the index, the exact location of the survey or report relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Walter S. Lewis of the textile division of the commission's staff, and of others.

TOPS AND YARNS OF WOOL OR HAIR

SUMMARY

TARIFF ACT OF SEPTEMBER 21, 1922

[Text of Schedule 11 providing for partial manufactures and for yarns of wool or hair]

PAR. 1106. Wool, and hair of the kinds provided for in this schedule, which have been advanced in any manner or by any process of manufacture beyond the washed or scoured condition, including tops, but not further advanced than roving, 33 cents per pound and 20 per centum ad valorem.

PAR. 1107. Yarn, made wholly or in chief value of wool, valued at not more than 30 cents per pound, 24 cents per pound and 30 per centum ad valorem; valued at more than 30 cents but not more than $1 per pound, 36 cents per pound and 35 per centum ad valorem; valued at more than $1 per pound, 36 cents per pound and 40 per centum ad valorem.

1. TOPS AND OTHER PARTIAL MANUFACTURES OF WOOL, MOHAIR, ALPACA, ETC.

Paragraph 1106 includes all partial manufactures of wool or hair, advanced beyond the raw material stage but not yet spun into yarn. Imports under this heading consist mainly of combed wool, known as "tops," to be spun into worsted yarn.

Of the important top-producing countries, the United Kingdom ranks first, the United States second, Germany third, and France fourth. Tops imported into the United States are largely from the United Kingdom; in 1924 France ranked second as a source of supply and was followed by Canada and Australia.

Prior to 1894 tops and other partial manufactures of wool were not mentioned in import statistics. Under the acts of 1894, 1897, and 1909 partial manufactures of wool or hair were listed in import statistics as one inclusive total, the wording under the act of 1894 being "roving, roping, or tops," and under the acts of 1897 and 1909 "wool or hair advanced in any manner or by any process of manufacture beyond the washed or scoured condition, n. s. p. f."[1] Under the act of 1913 imports of partial manufactures of wool or hair were recorded under four headings, as follows: "Tops of wool or camel's hair"; "Tops of mohair, alpaca, etc."; "Roving or roping"; and "Wool or hair advanced in any manner, or by any process of manufacture, beyond the washed or scoured condition, n. s. p. f." Under the act of 1922 imports of partial manufactures of wool or hair are recorded under the heading: "Wool or hair advanced in any manner or by any process of manufacture beyond the washed or scoured condition, including tops, but not further advanced than roving, n. s. p. f.," subdivided into those of mohair and those of wool or other hair.

[1] N. s. p. f.—not specifically provided for.

Wide fluctuations have occurred in imports of tops and other partial manufactures of wool and hair, largely because of changes in the rates of duty but also in certain periods because of other factors, such as the demand during the World War. The status of this import trade under four tariff acts may be summarized as follows:

Tops and other partial manufactures of wool, mohair, alpaca, etc.—Imports for consumption—Totals by tariff acts, 1894–1913

Tariff act	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate	Equivalent specific rate
	Pounds				*Per cent*	*Per pound*
Act of 1894 (936 days)	9,223,789	$3,053,565	$610,713	$0.302	20.00	$0.066
Act of 1897 (4,394 days)	17,262	14,577	14,748	.844	101.17	.854
Act of 1909 (1,609 days)	8,178	4,351	4,540	.532	104.34	.555
Act of 1913 (3,186 days)	26,816,997	17,668,535	2,022,117	.659	11.44	.754

Reducing the above figures to annual averages, comparisons may be made with the calendar years 1923 and 1924 under the act of 1922, as follows:

Tops and other partial manufactures of wool, mohair, alpaca, etc.—Imports for consumption—Average per year of 365 days, acts of 1894–1922

Tariff act	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate	Equivalent specific rate
	Pounds				*Per cent*	*Per pound*
Act of 1894	3,596,884	$1,190,760	$238,152	$0.302	20.00	$0.066
Act of 1897	1,434	1,211	1,225	.844	101.17	.854
Act of 1909	1,855	987	1,030	.532	104.34	.555
Act of 1913	3,072,255	2,024,173	231,661	.659	11.44	.754
Act of 1922:						
Calendar year 1923	3,980,450	2,426,718	1,798,892	.610	74.13	.452
Calendar year 1924	576,096	429,126	275,937	.683	68.76	.479

The average annual imports of 3,072,255 pounds under the act of 1913 consisted of 180,705 pounds of mohair, alpaca, etc., and 2,891,550 of wool or camel's hair. Of the 3,980,450 pounds imported in 1923, 48,216 were of mohair and 3,932,234 of wool or other hair; and of the 576,096 pounds imported in 1924, 26,591 were of mohair, and 549,505 of wool or other hair. The main counts of tops imported in 1923 were, in order of importance, as follows: 48s, 50s, 56s, 58s, 60s, 64s, 70s, 80s, 46s, and 44s.

The domestic production of tops in 1923 is estimated to have been about 200,000,000 pounds, so that imports in that year were probably around 2 per cent of production. Exports have always been exceedingly small.

2. Yarns of Wool, Mohair, Alpaca, etc.

Paragraph 1107 covers all yarns made of wool or hair. Imports are supplied mainly by the United Kingdom; smaller amounts come

from France, Germany, and Belgium. The status of this import trade under five tariff acts may be summarized as follows:

Yarns of wool, mohair, alpaca, etc.—Imports for consumption—Totals by tariff acts, 1890–1913

Tariff act	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate	Equivalent specific rate
	Pounds				*Per cent*	*Per pound*
Act of 1890 (1,548 days)	3,659,283	$2,236,311	$2,350,525	$0.611	105.11	$0.642
Act of 1894 (936 days)	6,563,156	3,187,414	1,214,198	.486	38.09	.185
Act of 1897 (4,394 days)	2,877,194	1,897,485	1,774,926	.659	93.54	.617
Act of 1909 (1,609 days)	868,500	723,568	623,172	.833	86.12	.718
Act of 1913 (3,186 days)	21,062,619	26,125,637	7,233,036	1.240	27.69	.343

The above figures, reduced to a uniform basis, the year of 365 days, may be compared with imports in the calendar years 1923 and 1924 under the act of 1922.

Yarns of wool, mohair, alpaca, etc.—Imports for consumption—Average per year of 365 days, acts of 1890–1922

Tariff act	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate	Equivalent specific rate
	Pounds				*Per cent*	*Per pound*
Act of 1890	862,815	$527,296	$554,226	$0.611	105.11	$0.642
Act of 1894	2,559,350	1,242,955	473,485	.486	38.09	.185
Act of 1897	239,002	157,620	147,439	.659	93.54	.617
Act of 1909	197,018	164,141	141,366	.833	86.12	.718
Act of 1913	2,413,012	2,993,050	828,643	1.240	27.69	.343
Act of 1922:						
Calendar year 1923	5,617,321	7,238,370	4,873,992	1.289	67.34	.868
Calendar year 1924	3,120,690	4,416,431	2,880,085	1.415	65.21	.923

The average annual imports of 2,413,012 pounds under the act of 1913 consisted of 549,839 pounds of mohair, alpaca, etc., and 1,863,173 of wool. Of the 5,617,321 pounds imported in the calendar year 1923, 2,567,270 were of mohair and 3,050,051 of wool or other hair; and of the 3,120,690 pounds imported in 1924, 1,355,400 were of mohair, and 1,765,290 of wool or other hair. Imports of woolen yarns are very small, the great bulk of yarns coming in being worsted. The leading numbers imported are probably 1/21s, 2/20s, 2/48s, and 2/70s of wool, and 2/28s and 2/32s of mohair.

The domestic production of yarns of wool, mohair, alpaca, etc., in 1923 was estimated at about 400,000,000 pounds, of which about 215,000,000 pounds were woolen and 185,000,000 pounds worsted Imports in 1923 were, therefore, in weight about 1½ per cent of the total production, or about 3 per cent of the worsted production. Exports of domestic yarns have been negligible.

SECTION 1

TOPS AND OTHER PARTIAL MANUFACTURES OF WOOL, MOHAIR, ALPACA, ETC.

General Information

Tariff Act of September 21, 1922

Par. 1106. Wool, and hair of the kinds provided for in this schedule, which has been advanced in any manner or by any process of manufacture beyond the washed or scoured condition, including tops, but not further advanced than roving, 33 cents per pound and 20 per centum ad valorem.

DOMESTIC PRODUCTION

Paragraph 1106 covers all partial manufactures of wool or hair advanced beyond the raw-material stage but not yet spun into yarn. It includes laps and sliver from the preparing machines, sliver from the worsted cards and can gill boxes, tops from the worsted comb, sliver from spindle gill boxes, sliver or drawing from draw frames, slubbing from slubbers, roving from worsted speeders, and laps and roving from woolen cards. It also includes dyed wool or hair. Combed wool or tops, used in the manufacture of worsted yarns, is the only article of commercial importance; the other partial manufactures are rarely bought or sold, being utilized in the mills where produced.

Raw materials and sources.—The raw materials of the wool-manufacturing industry are the wool of the sheep and the hair of the camel, Angora goat, Cashmere goat, alpaca, and other like animals. Of wool, the United States produces about half of its requirements; the main sources of importation in 1923 were South America, the United Kingdom, Australia, South Africa, and New Zealand. Of mohair, the United States produced about 60 per cent of its requirements; imports are mainly from England, Turkey, and South Africa. The other fibers mentioned are entirely of foreign origin. Camel's hair was imported mainly from China and Russia, Cashmere goat hair from England and China, and alpaca and vicuna from Peru.

Equipment.—Although various machines are used in the manufacture of the articles included under paragraph 1106, the most distinctive are the cards and the combs. The census shows the following data:

Table 1.—*Total number of cards and combs on wool in the United States, 1899–1925*

Year	Woolen cards [1]	Worsted cards	Worsted combs	Year	Woolen cards [1]	Worsted cards	Worsted combs
	Sets				*Sets*		
1899	6,605	(2)	1,451	1914	5,382	2,153	2,425
1904	6,142	(2)	1,549	1919	5,835	2,143	2,294
1909	5,555	(2)	2,120	1925 (May) [3]	7,081	(2)	2,714

[1] Includes shoddy cards.
[2] Not reported.
[3] Based on reports received by the Bureau of the Census from 951 manufacturers, operating 1,112 mills. This is exclusive of 11 manufacturers operating 16 mills, who failed to report for the month of May; these mills had about 125 sets of woolen cards and 14 worsted combs.

Of the 1,451 wool-combing machines used in 1899, 76.8 per cent were of foreign manufacture; of the 2,294 combs used in 1919, ~~76.8~~ 67.8 per cent were of foreign manufacture. Information is not available as to the proportion of domestic and foreign-made combing machines used in 1925.

Preliminary treatment of raw fibers.—As the original wool or hair fibers pass through many processes before reaching the condition of the materials described in paragraph 1106, the manner in which the original fibers are commonly handled and manipulated will be briefly outlined.

Wool fleeces are usually baled and shipped as sheared from the sheep; that is, "in the grease," without being washed or scoured. On receipt at the mill they are first sorted into grades, according to length, fineness, elasticity, and strength. Although it is customary to divide a fleece into 5 to 7 grades, the wool from a single sheep is sometimes sorted into as many as 13 or 14 grades. Hair of the Angora goat, the Cashmere goat, the alpaca, and like animals is sorted in a way similar to that of wool. Sorting or grading are necessary processes because wool varies widely in quality with the breed of the animal and the part of the body from which it is taken. It is clear, therefore, that any attempt to utilize the total clip from one animal as a homogenous mass would be uneconomical. In general, the long-staple fibers are used in worsted manufacturing, while the short-staple fibers are employed in woolen manufacturing. There are, however, other essential differences between woolen and worsted manufacturing besides length of staple. For instance, it is possible to use one-half of a bag of wool for making woolen yarn and the other half for worsted yarn.

The difference between these two types of yarns is largely brought about by the different kinds of machinery employed in the woolen and worsted industries. Wool and hair fibers contain varying degrees of grease and dirt, and if a large quantity of foreign matter is present they must be put through a machine which mechanically removes much of the dirt, straw, and other extraneous matter. If the raw fibers are in a fairly clean condition, this dusting or cleaning is omitted. When fibers are washed, scoured, or otherwise freed from grease and other foreign substances, the resulting product is known as scoured wool or hair.

Some wools and hair contain vegetable impurities even after being scoured, and these are removed by carbonizing. The vegetable matter is disintegrated by this process, and subsequent washing, heating, drying, and dusting reduce it to powder, leaving the wool in a thoroughly clean condition known as carbonized wool. The carbonizing of scoured wool is usually carried out only when the fiber is to be used for woolen yarns, because in the production of worsted yarns the vegetable impurities are nearly all removed in the carding and combing processes.

The various stages through which the wool and hair fibers must pass from their original state and up to the time they are ready to be spun into yarn are presented graphically in Chart A.

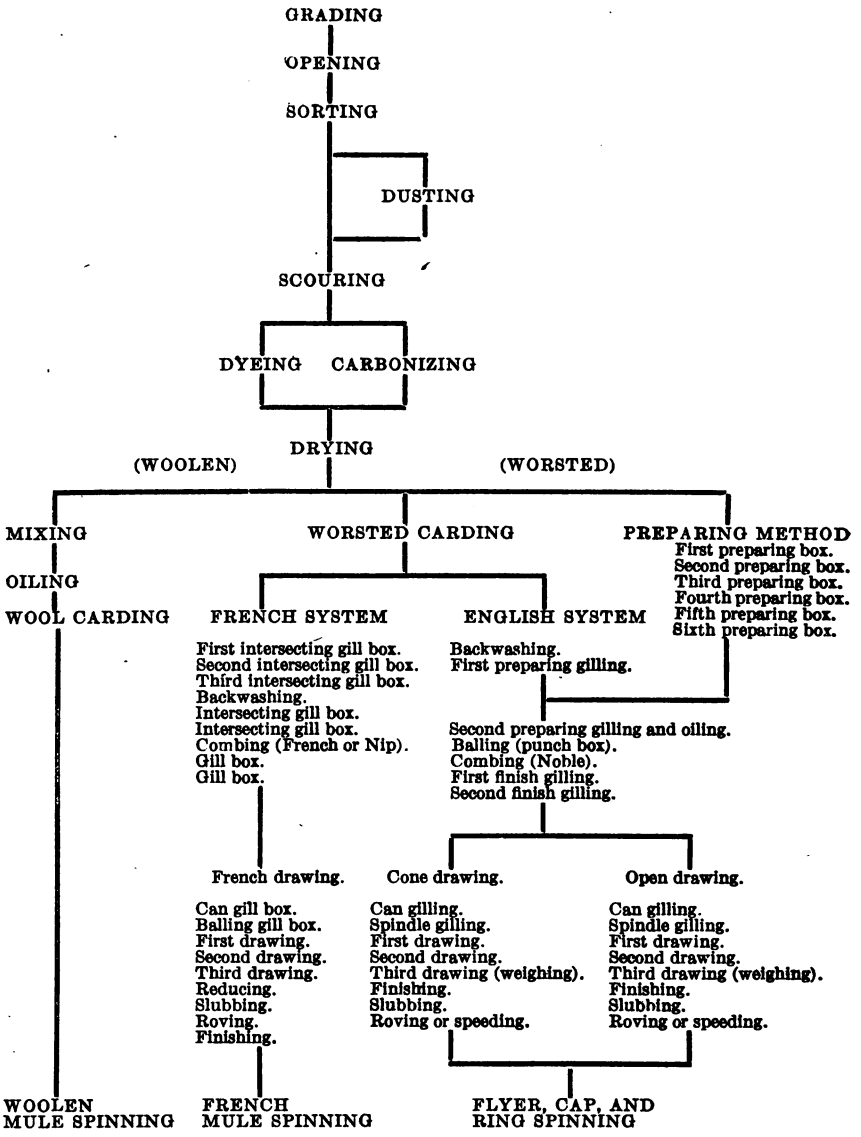

CHART A.—Sequence of processes in the manufacture of woolen and worsted yarns, as published in Bulletin No. 238, June, 1918, of the U. S. Bureau of Labor Statistics.

Methods of production.—Methods of production vary according to the type of material used and the kind of product desired.

As shown in the above chart, the production of woolen yarn requires few processes, whereas that of worsted yarn requires many processes and may employ various systems of manufacture.

In woolen manufacturing, the scoured wool, which may or may not have been carbonized, is too dry to be properly worked, and it is sprinkled with oil or oil emulsion. This lubricates the fibers, and the uniform penetration of the oil results in reduced waste and a more

workable material for later machine processes. The clean, oiled wool is put through a machine called a mixing picker, which separates the larger masses of fiber, thoroughly mixes them, effects a more thorough distribution of the oil, and finally produces a relatively loose mass of separated fibers. The wool is then carded. The primary object of carding is (1) to remove as far as possible all knots, seeds, and burrs, (2) to separate one fiber from another, and (3) to arrange the fibers into a continuous strand, all parts of which are uniform in structure and weight.

Carding causes the fibers to be brushed out into a thin sheet, which in turn is condensed into a round, soft, fuzzy strand known as roving or roping. No attempt is made to parallel the fibers which are of different lengths. The woolen "roving" (really sliver since it contains no twist) thus formed is wound on long spools or bobbins and is then ready to be spun into woolen yarn. Woolen roving is seldom bought or sold as an article of commerce, because it is commonly used as one of the products in the continuous operations of woolen manufacturing.

In worsted manufacturing it is customary to subject the scoured wool to both carding and combing. Long wools are generally put through preparing machines which open up the wool fibers, separate and lay them parallel or nearly so, and by drawing the fibers out into a sliver, put them into a fit condition for combing. Medium-length wools are usually passed through the worsted card;[2] the sliver therefrom is backwashed and drawn out by gill boxes before being combed. Shorter wools are, as a rule, treated by the so-called French system, which prepares the fiber in a manner similar to that described for medium wools. The first two methods are commonly known as the English system.

Combing, the next major machine process in preparing the fiber for spinning, arranges the fibers in a parallel position and removes a certain percentage of the shorter fibers (noil) and any foreign matter. If the fiber is oiled before being combed, the result is oil top, but if it is combed without oil it is known as dry top. The operation of combing is very complicated and requires highly specialized machinery. The leading wool combs are known as (1) Noble, (2) Holden, (3) Lister, and (4) French or Heilman. The Noble comb is most widely used in the United States because of its adaptability to the wools consumed in this country; the French comb, practically the only other kind employed, is particularly suitable for short wools, and is also extensively adopted for soft yarns for knit and dress goods. It is estimated that 75 per cent of the combs used in this country are of the Noble type and 25 per cent are French. The latter, however, is said to be gaining in favor over the former. The Noble comb predominates in the United Kingdom, although the Lister and the French comb are much used; Germany uses almost wholly the French comb; and France the French, the Noble, and the Holden.

There is considerable diversity in the types of combs used abroad, and the rate of production varies with each type, but the basic principle is the same in all. Several strands of slivers are run together into

[2] The worsted card differs from the woolen in construction and in combination of parts, but the operation is similar in principle in the two types of machines.

the combing machine, and the product is a continuous untwisted strand of parallel fibers. The combed sliver is known as tops.

In French combing a much shorter staple can be used than is required in English combing. This difference is illustrated by Table 2.

TABLE 2.—*Length of fiber required for combing*

	French combing	English combing
(a) Fine wools	1¼ to 2 inches	Over 2 inches.
(b) Medium wools	1½ to 2¼ inches	Over 2¼ inches.
(c) Coarse wools	2 to 3 inches	Over 3 inches.

The two systems of drawing in general use—the English and the French—are in principle the same. More processes, however, are required by the French system and the product has no twist; by the English or Bradford system some twist is imparted. Most fine wools are combed by the Bradford system, although large quantities are put through French combs. The proportion combed by the French system depends to a considerable extent on where the wool was grown, as climatic conditions affect the length and soundness of the fiber.

After combing, the top is subjected to a drawing process, the object of which is to straighten the fibers, reduce the size of the combed sliver, render it more nearly uniform, and make it ready for spinning. To obtain the top desired, it is customary to put the combed sliver through gill boxes once more; that is, a number of these slivers are passed through each gill box and drawn out into one strand. The strand thus produced is coiled into flat-end balls (tops) of equal weight, and in this shape is ready for shipment or for further manufacture in the mill where made. Many machines are required to obtain this result, the number varying according to the character of the wool and the kind of yarn to be produced.

Classification of tops.—The classification of tops made for sale is based on the quality of the wool from which it is combed. This quality represents fineness, soundness, and length of staple, but neither in this country nor abroad have grades or standards been fixed or codified by any public or official body.[3] Nevertheless, by force of custom, the variation in standards among top makers is not great, for there is a fairly close agreement among producers and traders as to what a top of a specified grade should be.

The quality of any given type of wool may vary widely, depending upon the breeding and the physical condition of the sheep, the locality in which it is raised, the weather, and many other variable factors. These various conditions, of course, affect the character of the top, which will correspond in quality to the raw wool from which it is produced. However, the relation between the count of the top and the count or fineness of the yarn which may be spun from it is not so close. Thus, yarn produced from tops coarser than 64s is rarely as

[3] For some time, however, the United States Department of Agriculture has been endeavoring to establish standard lengths of staple for the classification of raw wool grades according to the usual commercial divisions. This work has been carried on in cooperation with producers and manufacturers of wool in this country and abroad.

fine as the tops, whereas yarns from 64s and finer tops may be spun to the same or sometimes to an even greater degree of fineness.

The following table shows the grades of raw wool employed in the United States and the grades of tops that are usually produced from these wools.

TABLE 3.—*Tops produced from various grades of wool*

United States raw-wool grades	Tops produced	United States raw-wool grades	Tops produced
Fine	64s to 66s	High ¼ blood	50s
Half blood	60s to 64s	Average ¼ blood	48s
High ⅜ blood	58s	Low ¼ blood	44s
Average ⅜ blood	56s	Common	40s
Low ⅜ blood	52s to 56s	Braid	36s

Organization.—Partial manufactures of wool or hair are incidental and preliminary to the manufacture of yarns, and, with the exception of tops, they are seldom articles of commerce. In the development of the trade in tops in the last 30 years, a type of organization known as commission combing has grown into a large branch of the worsted industry. This specialized industry had long been common in England and Europe, but it was not until the late nineties that it was established in the United States. To-day there are 10 or 12 mills whose sole business is commission combing, and there are several others that combine commission combing with other manufacturing activities. While the bulk of the tops turned out for sale are probably produced by commission combers, large quantities are sold by mills producing other goods, and there are mills that sell tops as a side issue in order to keep their combing machinery occupied and to take advantage of a good market, or for some other purpose.

Prior to 1894, imports of tops were not separately recorded but were probably very small. During the years 1894–1897, under the tariff act of 1894, importations of tops were large, and in 1897 exceeded 5,000,000 pounds. Owing to this, certain worsted manufacturers became accustomed to purchasing tops, and a market for them was established. After the passage of the higher tariff act of 1897 imports almost entirely ceased, and this created an opportunity for the development of the new industry of producing tops. Their manufacture for sale in this country gradually increased, and as the consumption of worsted cloths became greater, top making began to branch off as an independent industry. This trend of business brings the industry more into line with the long-established method followed in England and Europe.

From recent observation it appears that, of the total quantity of tops purchased in the market, the proportion sold by worsted manufacturers as an individual product has decreased and that the larger part of the demand is now supplied by specialized top makers.

Geographical distribution.—No statistics are available to show the domestic production of tops and other partial manufactures of wool and hair, but as tops are the product of the combing machine, the number of such machines, which is reported by the Department of Commerce to be 2,714 installed in 1,112 mills in the United States in

May, 1925, gives a fair indication of their productive capacity. Table 4 shows the distribution of these machines, by States, for census years since 1889.

TABLE 4.—*Total wool-combing machines, 1889–1919*

State	1889	1899	1904	1909	1914	1919
Massachusetts	265	424	497	703	918	862
Rhode Island	193	287	291	461	522	385
New Jersey	29	128	169	268	349	368
Pennsylvania	188	357	377	354	320	343
New York	84	116	74	141	143	157
New Hampshire	29	34	24	52	52	52
Connecticut	27	57	37	52	29	21
Maine	5	19	26	29	32	41
Wisconsin			8	13	11	11
All other	19	29	46	47	49	54
Total	839	1,451	1,549	2,120	2,425	2,294

For 1919 the census reported that approximately 38 per cent of all combing machines were in Massachusetts. 17 per cent in Rhode Island, 16 per cent in New Jersey, 15 per cent in Pennsylvania, 7 per cent in New York, less than 2.5 per cent in New Hampshire. Of the remainder, some were installed in mills in Maine, Vermont, and Connecticut, some in the Middle West, and a few in the Southern States. The northeastern States, therefore, predominate in the manufacture of tops, and Massachusetts far exceeds all other States.

Domestic production and consumption.—Domestic production can not be stated, except for tops, which probably average above 200,000,000 pounds per year. Of this quantity the greater portion is made from the wool of the sheep by mills which take the raw wool and work it into a form more advanced than tops.

Thirty years ago tops were negligible as an article of trade and commerce, because each mill carried through the whole manufacuring process, from the wool in the grease to yarn or cloth. In recent years, however, tops have become more and more important in domestic commerce. In 1899 wool manufacturers purchased 5,865,566 pounds of tops in the market; in 1909 purchases had increased to 21,103,510 pounds, valued at $14,755,409; in 1914 to 29,177,790 pounds, valued at $16,717,322; and in 1919 to 26,466,973 pounds, valued at $45,621,904.

The amounts purchased in 1899 and 1909 were almost entirely of domestic production, as imports were negligible. In the calendar year 1914, when the purchase of tops amounted to 29,177,790 pounds, imports for consumption were 6,145,608 pounds; in 1919, tops purchased totaled 26,466,973 pounds, while imports amounted to only 731,955 pounds. There are no available statistics as to the quantity of tops purchased in 1923, but importations probably exceeded 3,750,000 pounds, in as much as tops combined with other partial manufactures, which are included in paragraph 1106, amounted to 3,980,450 pounds.

The domestic trade in wool tops extends to all qualities. Tops of mohair, alpaca, etc., are articles of commerce to a limited extent, but trade in the open market is small compared with the quantity produced by mills for their own use. The annual imports for the years 1914–1922 averaged about 180,000 pounds.

Domestic exports.—Export statistics were first recorded in 1922, when shipments of domestic-made tops amounted to 42,003 pounds, valued at $26,794, the entire quantity going to Canada. Also during that year, 66,262 pounds of foreign tops were exported, of which Canada took 62,154 pounds. Exports of domestic tops were not specifically recorded in our statistics in 1923 and 1924, but exports of foreign-made tops in those years were 335,007 pounds and 662,528 pounds, respectively. Official reports of Canada, however, show importations from the United States as follows:

TABLE 5.—*Wool tops—Canadian imports from United States,*[1] *1918–1925*

Fiscal year (ended Mar. 31)—	Pounds	Value	Fiscal year (ended Mar. 31)—	Pounds	Value
1918	(2)	$4,496	1922	337,691	$161,166
1919	None.	None.	1923	270,812	215,912
1920	(2)	3,170	1924	267,791	239,366
1921	442,366	454,389	1925	253,203	321,151

[1] Tops were not separately listed in Canadian import statistics prior to the fiscal year 1918.
[2] Not shown.

Total imports of worsted tops into Canada for 1925 amounted to 5,164,151 pounds, valued at $3,550,542, the United Kingdom furnishing the bulk.

Commission charges for combing.—Table 6 compares American and English commission rates for combing, including profit. The English rates, converted into United States currency as of June 2, 1924 (at £1 = $4.3076), are of the same date as the American rates and therefore the two are comparable.[4]

TABLE 6.—*Commission charges for wool combing in England and the United States in 1924* [1]

[Charges in cents per pound]

Type of wool and proportion of top to noil	English rate	American rate	Type of wool and proportion of top to noil	English rate	American rate
Merinos, tearing 5 to 1 and over	$0.103	$0.17	50s, 5 and under 7 to 1	$0.088	$0.145
Merinos, 4 and under 5 to 1	.112	.18	40s, 8 to 1 and over	.072	.105
Merinos, 3 and under 4 to 1	.121	.19	40s, 6 and under 8 to 1	.081	.11
56s, 7 to 1 and over	.088	.155	Preparing, 32s to 36s	.063	.09
56s, 5 and under 7 to 1	.097	.16	Average	.0904	.1445
50s, 7 to 1 and over	.079	.14			

[1] Rates include no charge for the raw material or the cost of holding such material during the manufacturing operations.

NOTE.—The word "tearing" means the proportion of top to noil; thus 5 to 1 means five parts of top to one of noil.

Figures in the above table show that the English rates averaged 5.4 cents per pound, or 37½ per cent lower than the average American rates.

By-products in top manufacture.—Under normal conditions, between 80 and 90 pounds of tops are produced from 100 pounds of scoured wool. If the output of tops is less than 80 per cent, either the scoured wool used is inferior or the method applied is unusual. An output of more than 90 per cent indicates not only a very superior

[4] In the appendix will be found a table of combing charges in England and the United States for 1914 and for several years since the war.

grade of wool, but greater skill and efficiency in manufacture. According to the Tariff Board report of 1912, the average yield was approximately 85 pounds of tops from 100 pounds of scoured wool. The most important by-product in the manufacture of tops is the noil; card waste and other wastes accumulating from the various machines employed are less valuable. Of the total weight of noils and wastes, noils constitute from 60 to 90 per cent, according to the quality of wool used and the manufacturing process employed in top making. The value of each type varies greatly, depending not only on differences in quality but very largely on whether the consuming public requires woolen or worsted materials. If woolens are most in demand, noils (which are a by-product of the worsted industry and a valuable raw material in the manufacture of woolen goods) bring a higher market price because worsted manufacturing is reduced, with the result that noils are produced in smaller quantities and consumed in larger amounts. In 1920, when worsted goods were in great demand, noils were selling for 28 to 55 cents per pound; whereas in 1924, when woolen goods were popular, noils were selling at from 80 cents to $1.15 per pound. Of course, many other factors influence the market price of noils, namely, periods of depression or prosperity, style of clothing, raw-wool production and prices, and the effect of the tariff on imports.

Foreign Production

In England and in continental Europe the production of tops is ordinarily carried on in establishments designed for the purpose, and as a result the trade in tops is much more extensive abroad than in the United States. The chief top markets, having established exchanges for dealing in tops, are Bradford, England; Roubaix, France; Antwerp, Belgium; and Leipzig, Germany.

Although no statistics showing the actual production of tops in the principal foreign countries are available, the number of combing machines afford a fair basis of comparison. For these the most recent available data are given in Table 7.

Table 7.—*Wool-combing machines in principal foreign countries*

Country	Year	Number of combing machines
United Kingdom	1918	2,952
Germany	1907	2,119
France	1922	1,757
Italy	1924	500
Belgium	1924	340
Japan	1924	500

Note.—The Census Bureau reported 2,714 wool-combing machines in the United States in May, 1925.

The foreign countries of greatest importance in the manufacture of tops are the United Kingdom, Germany, France, Belgium, and Italy. The United Kingdom leads in exports and is usually considered the largest producer. English authorities estimate the yearly production of the United Kingdom at between 250,000,000 and 300,000,000 pounds, of Germany at 175,000,000 pounds, and of France at 130,000,000 pounds. Official figures on the international trade of the three leading European countries and of the United States are shown in Table 8.

TABLE 8.—*Wool tops—General imports and exports, 1909–1924*

[Quantity in pounds]

	United States	United Kingdom	Germany	France
1909:				
Imports	[1] 2,248	[2]	49,523,253	572,535
Exports	[2]	40,676,500	21,438,192	63,993,365
1913:				
Imports	[1] 527	[2]	39,968,296	3,583,577
Exports	[2]	43,633,100	23,659,416	50,087,850
1922:				
Imports	4,707,892	4,550,100	17,990,638	6,347,043
Exports	108,265	41,603,500	2,571,005	52,676,730
1923				
Imports	3,904,578	5,779,200	12,786,239	1,392,425
Exports	[2]	38,995,200	17,131,947	39,906,347
1924:				
Imports	428,718	4,759,200	15,917,212	2,041,681
Exports	[2]	41,228,900	14,175,578	40,906,133

[1] Includes tops and other partial manufactures of wool or hair.
[2] Not recorded but probably negligible.
[3] Statistics not recorded. Canadian statistics show that 270,812 pounds were imported from the United States for the year ended Mar. 31, 1923; and 267,791 for the year 1924.

In Japan, wool manufacturing is expanding much more rapidly than the production (growing) of wool. This has been brought about by the increasing use of wool wearing apparel by the Japanese people and by the fact that the production of raw wool is small because of the limited acreage upon which to raise sheep. Therefore, to keep her weaving mills running, Japan must import either the necessary raw wool or wool products such as tops and yarns. Imports of wool tops are shown in the following table:

TABLE 9.—*Wool tops—Imports by Japan, 1914–1923*

Year	Pounds	Year	Pounds
1914	8,131,369	1919	4,285,510
1915	5,141,439	1920	3,784,180
1916	5,930,778	1921	5,473,093
1917	5,721,377	1922	7,835,000
1918	3,370,815	1923	10,361,000

The production of tops in Japan was not recorded prior to 1916, when it amounted to 7,706,000 pounds; in 1920 it increased to 12,530,000 pounds, and in 1923 to 18,659,032 pounds.

IMPORTS

Imports of partial manufactures of wool were not separately recorded prior to the act of 1894, when figures were given for inclusive imports of "roving, roping, or tops." In the tariff act of 1894 all kinds of tops, roving, and other partial manufactures of wool, mohair, etc., were grouped together in imports for consumption statistics. The largest yearly importation during the period of this act was in the fiscal year 1897, when 5,662,953 pounds, valued at $1,821,405, were recorded.

During the life of the tariff acts of 1897 and 1909, a period covering nearly 16½ years, imports of tops, etc., were negligible, the highest recorded for any one year being $1,690 in 1904.

The tariff act of 1913 classified tops into two general groups—(1) tops made from wool or camel's hair and (2) tops made from the

hair of the Angora goat, alpaca, and other like animals, and fixed the duties on these two groups at 8 and 20 per cent, respectively. The equivalent ad valorem rate of duty dropped from 108.54 per cent, which was the rate for the last six months of the act of 1909 with wool dutiable, to 8.09 per cent for the first six months under the act of 1913 with wool on the free list. Importations of tops immediately increased, amounting to $1,464,643 out of a total of $1,490,097 reported as the value of tops and other partial manufactures imported in the first six months of 1914. (See Tables 10, 10A, and 10B.) The corresponding figures for the fiscal year 1915 were $1,796,580 and $1,800,486, respectively. Under the act of 1913 statistics were also given separately for imports of roving or roping and for all other partially manufactured wool or hair not specially provided for. Figures for these two classifications are shown in Tables 10C and 10D, the rate of duty being 8 per cent for each division.

Owing to the war, imports showed a heavy falling off in 1916 and up to the year 1919 they continued to be relatively small. It is of interest to note that in the years 1916 and 1917 tops made of the hair of the Angora goat, alpaca, or like animals, were imported in larger quantity than tops made from wool or camel's hair. The World War caused a change in the character of the tops imported, and, as shown in Table 10, imports decreased to a low point during this period. They were least in the fiscal year 1917, when their total value was $75,197.

Directly after the war, imports of partial manufactures of wool or hair, mainly tops, began to increase. Imports in 1919 were valued at $848,675 and in 1920 at $1,348,276, while in 1921 they attained the record of 15,389,644 pounds, valued at $10,298,562. Of the 1921 import tops alone totaled 15,180,960 pounds, valued at $10,095,185. This extraordinary increase may be attributed to the anticipation of higher duties, greater domestic consumption, and surplus stocks in foreign countries. Statistics also show that 14,872,136 pounds of tops, valued at $9,927,878, were imported between January 1 and May 28, 1921, the latter date being the day that the emergency tariff act became effective. This temporary law (the emergency tariff act) imposed a specific duty of 45 cents a pound in addition to the ad valorem duties of the previous act. Although the higher equivalent ad valorem rate of duty immediately reduced imports, nevertheless considerable quantities continued to come in. The act was in operation from May 28, 1921, to September 21, 1922 (482 days), during which time importations amounted to 1,100,203 pounds, valued at $1,065,275. Tops alone constituted 1,099,498 pounds, having a value of $1,063,693. The higher rates of duty are particularly reflected in the increased equivalent ad valorem rate during the period January 1 to September 21, 1922, as shown in Table 10.

In the present tariff act, which became effective on September 22, 1922, tops, roving, roping, etc., are classified together. The rates of duties provided under this act seem to have had little influence on imports in 1923, for in that year they amounted to 3,980,450 pounds, valued at $2,426,718, and the equivalent ad valorem rate was 74.13 per cent. Official import figures for 1923 do not separate tops from the other partial manufactures, but it may be assumed that at least 3,750,000 pounds of tops were imported during that year. However,

in 1924 the decrease in imports as compared with those of 1923 was marked, for only 576,096 pounds came in, having a value of $429,126, with an equivalent ad valorem rate of 68.76 per cent. Of the total quantity imported in 1924, less than 5 per cent was of mohair, the bulk being listed as made of wool or other hair.

Imports for consumption.—Table 10 is a summary of the total imports for consumption, of partial manufactures of wool or hair, beginning with the act of 1894. Subsidiary Tables 10A, 10B, 10C, and 10D show, respectively, imports of tops of wool or camel's hair, tops of mohair, alpaca, etc., roving or roping, and partially manufactured wool or hair, n. s. p. f., for periods during which these were separately recorded.

TABLE 10.—*Total tops, roving, and other partial manufactures of wool, mohair, alpaca, etc.*[1]*—Imports for consumption—Revenue, 1895–1924*

Fiscal year (unless otherwise stated)	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate
	Pounds				*Per cent*
1895 (Jan. 1 to June 30)	1,567,372	$501,344	$100,269	$0.320	20.00
1896	1,147,461	438,417	87,683	.382	20.00
1897	5,662,953	1,821,405	364,281	.322	20.00
1898 (July 1 to July 24, 1897)	846,003	292,399	58,480	.346	20.00
Total (936 days, act of 1894)	9,223,789	3,053,565	610,713	.302	20.00
Annual average (act of 1894)	3,596,884	1,190,760	238,152	.302	20.00
1898 (July 25, 1897, to June 30, 1898)	1,229	837	979	.681	116.97
1899	3,607	3,345	3,276	.927	97.94

[1] Not separately recorded prior to act of 1913.
[2] Includes roving or roping.
[3] Includes 336 pounds, valued at $964, paying emergency tariff act surtax of 45 cents a pound in addition to the regular duty of 8 per cent ad valorem.
[4] Dutiable under emergency tariff act at 45 cents a pound and 8 per cent ad valorem.

General imports.—General imports of tops, by countries, were not recorded prior to 1916. Table 11 shows the countries furnishing these imports and the quantities supplied by each country for the years 1916–1924:

TABLE 11.—*Wool tops*[1]*—General imports, by countries, 1916–1924*

[Quantity in pounds]

Country of origin	Fiscal year—			July 1 to Dec. 31, 1918
	1916	1917	1918	
United Kingdom	447,958	1,039	17,353	
Australia			40	
France	25,192

France		141,951	400,611	382,473	301,839	168,663
Argentina	14,609	21,883		206,066	312,638	
Belgium		35,001	224,373	73,893	65,790	
Canada	653	26,088	82,808	17,389	196,129	37,512
Italy		240				
Spain		16,163				
Bolivia		58				
Chile		6,699				
China		592			31,103	
Japan	20,061		26			
Switzerland			20,754			
Total	980,914	1,175,052	15,038,617	4,707,892	3,904,578	529,922

[1] Wool and hair advanced in any manner, including tops.

In 1916 the United Kingdom furnished 93 per cent of the total quantity; in 1917 and 1918 imports were relatively small and came largely from South America; in 1919, 53 per cent came from Australia and 42 per cent from the United Kingdom. In 1920 Australia and the United Kingdom furnished about equal quantities, approximately 40 per cent each, and France about 12 per cent. In 1921 the United Kingdom far exceeded all other countries, sending to this country 88 per cent of the total, while Australia furnished only about 7 per cent. During 1922 the United Kingdom supplied nearly 61 per cent, Australia 15 per cent, Germany 9 per cent, and France 8 per cent. In 1923, 71.8 per cent came from the United Kingdom, 8 per cent from Argentina, 7.7 per cent from France, 5 per cent from Canada, 4.5 per cent from Australia, 1.7 per cent from Belgium, 0.8 per cent from China, and 0.5 per cent from Germany. During 1924 the United Kingdom furnished 55 per cent, France 32 per cent, Canada 7 per cent, Australia 5.4 per cent, and Germany three-tenths of 1 per cent of the total quantity imported.

Table 12 shows the average value per pound of wool tops and other partial manufactures of wool or hair imported from the countries furnishing the bulk of these commodities, also the average value for all countries, during the years 1919 to 1924 inclusive.

TABLE 12.—*Wool tops—Average import values per pound, 1919–1924*

Country of origin	1919	1920	1921	1922 [1]	1923 [1]	1924 [1]
United Kingdom	$0.71	$1.01	$0.63	$0.55	$0.64	$0.88
Argentina	1.44	1.75		.22	.26	
France		1.67	.83	.98	.95	.90
Canada	.92	1.48	1.28	.35	.53	.41
Australia	1.64	1.18	.75	1.03	1.05	.71
Belgium		2.58	1.31	.74	.96	
Germany			.66	1.09	.94	.78
Average for all countries	1.23	1.23	.66	.70	.65	.85

[1] Includes also other partial manufactures of wool or hair.

Table 12 shows that in 1919 the unit value of wool tops from Australia was highest, with Argentina second, Canada third, and the United Kingdom fourth. In both 1920 and 1921 the unit value was highest for Belgium and lowest for the United Kingdom. In 1922 and 1923 the value per pound of tops, including other partial manufactures, averaged highest for Australia, with tops from Germany, France, and Belgium nearly as high; those from the United Kingdom were only 57 per cent of the average value of those from Australia. Argentina furnished tops of the lowest value, the unit value per pound being only 23 per cent of those coming from Australia. For 1924 the unit value per pound of imports averaged the highest for France. Using the French unit value as a basis of comparison the average value of tops from other countries was 2 cents less for the United Kingdom, 12 cents for Germany, 19 cents for Australia, and 49 cents for Canada.

The Department of Commerce reports the entrance into this country of wool tops and wool and hair advanced, by customs districts, as follows:

TABLE 13.—*Wool tops—Imports by customs districts, 1919–1924*

[Quantity in pounds]

Customs district	1919	1920	1921	1922 [1]	1923 [1]	1924 [1]
Massachusets	819,028	808,676	10,626,472	4,340,270	3,054,822	301,053

Total	980,914	1,175,052	15,038,617	4,707,892	3,904,578	529,922

[1] Figures include other partial manufactures of wool or hair.

Table 13 shows that Massachusetts received far larger quantities than any other State. For three years preceding 1922, New York held second place, but since that year Philadelphia has been second.

The percentages in Table 14, based on the figures in Table 13, are given for the four leading States since 1919.

TABLE 14.—*Wool tops—Imports by customs districts, 1919–1924*

[Per cent distribution]

Customs district	1919	1920	1921	1922 [1]	1923 [1]	1924 [1]
Massachusetts	83.50	68.82	70.66	92.19	78.24	56.81
New York	12.53	13.13	21.60	3.48	3.22	38.32
Philadelphia	.26	6.69	3.99	3.93	16.50	4.87
Rhode Island	3.70	8.85	.54	.36	1.37	None.
All other	.01	2.51	3.21	.04	.67	[2]
	100.00	100.00	100.00	100.00	100.00	100.00

[1] Includes also other partial manufactures of wool or hair.
[2] Negligible.

Boston has always been the largest port of entry, probably because Massachusetts consumes greater quantities of these products than any other State.

Character of imported tops.—The types of tops most commonly imported in 1923 at Boston, and these were in all probability characteristic of the whole country, were 48s, 50s, 56s, and 58s; those coming in to a less extent, in the order of quantity, were 60s, 64s, 70s, 80s, 46s, and 44s. Imports in 1924 consisted mainly of the types imported in 1923, except that the largest single item was 60s black.

PRICES

Landed costs of tops invoiced at various prices.—Table 15 shows the landed costs and the wholesale selling prices in the United States of tops invoiced at from 30 cents to $1.75 a pound. The landed costs are derived by adding to each arbitrary invoice price the probable landing charges and the equivalent specific duty applicable under the act of 1922. These landed costs plus 5 per cent for the expenses and profit of the importer give the probable wholesale selling prices on the American market.

TABLE 15.—*Landed costs and probable selling prices in the United States of wool tops invoiced at various prices per pound*

Foreign selling price	Landing charges [1]	United States duty	Total landed cost	Probable selling price in United States [2]
$0.30	$0.03	$0.39	$0.72	$0.76
.40	.03	.41	.84	.88
.50	.03	.43	.96	1.01
.60	.03	.45	1.08	1.13
.70	.03	.47	1.20	1.26
.80	.03	.49	1.32	1.39
.90	.03	.51	1.44	1.51
1.00	.03	.53	1.56	1.64
1.10	.03	.55	1.68	1.76
1.20	.03	.57	1.80	1.89
1.30	.03	.59	1.92	2.02
1.40	.03	.61	2.04	2.14
1.50	.03	.63	2.16	2.27
1.75	.03	.68	2.46	2.58

[1] Includes ocean freight, insurance, and commission charges.
[2] Includes 5 per cent on landed cost for importer's overhead and profit.

Comparison of United States prices of imported and domestic tops.—The types of comparable English and American tops selected for price-comparison purposes are given below:

English quality	Comparable United States type
Merino:	
70s average	Fine.
60s ordinary	Half blood.
Cross-bred colonial carded:	
58s super comeback	High three-eighths blood.
56s average	Low three-eighths blood.
50s average	High one-fourth blood.
44s average	Low one-fourth blood.

Table 16 shows the actual selling price per pound of English tops in England, their probable landed cost and selling price in this country, and the price at which comparable United States tops were sold during the months of May, 1914, May, 1924, and February, 1925.

TABLE 16.—*Approximate selling price per pound in the United States of English and comparable American wool tops during May, 1914, May, 1924, and February, 1925*

Quality	Year and month	Selling price in England [1]	United States duty	Landing charges [2]	Total landed cost of English tops in United States	Probable selling price of English tops in United States [3]	Selling price of comparable United States tops [4]

[1] Prices for English tops were converted into United States currency at par for 1914, for 1924 at the rate of exchange on May 17, and for 1925 at the rate of exchange on February 13.
[2] Includes freight, insurance, and commission charges.
[3] Includes 5 per cent on landed cost for importers' overhead and profit.
[4] Prices obtained from the Textile World.

The figures in the above table show that the United Kingdom can compete on the American market only in certain kinds of tops. They also show that the United States can not compete with the United Kingdom in world markets. When domestic mills buy direct from foreign sources, the total landed cost of English tops must be the basis of comparison with American selling prices.

Using the prices quoted in Table 16 as a basis of comparison, the average price of wool tops in the United States was higher than the average price in England by 19.5 per cent in 1914, 45.5 per cent in 1924, and 58.1 per cent in 1925. Furthermore, the average price of American tops on the domestic market in February, 1925, was 22.5 per cent above that in May, 1924, and the average price of similar English tops on the English market was 12.7 per cent higher in February, 1925, than that in May, 1924. The higher selling prices of this commodity in the two countries in 1924 and 1925, as compared with 1914, were due primarily to higher raw-wool prices and greater manufacturing costs, including higher wages based on increased living costs. The variation in the rate of increase for different qualities of tops was caused mainly by the quantity available, the demand, and the price variation in the particular grades of wool required. A further analysis of Table 16 shows that the percentage increase in the selling prices in 1924 over 1914 for English

tops in England and for comparable American tops in the United States was as follows:

TABLE 17.—*Increase in selling prices of wool tops in 1924 as compared with 1914* [1]

[1] Raw wool entered the United States free of duty in 1914 but was dutiable in 1924.

TARIFF HISTORY

In the tariff act of 1883 imports of partial manufactures of wool or hair were dutiable, without specific mention, under the basket paragraph of the wool schedule. Partial manufactures of wool or hair were not specifically recorded in import statistics during the period of this act.

In the act of 1890, roping, roving, or tops made from wools and hair of the camel, goat, alpaca, or other like animals, and all wool and hair which have been advanced in any manner or by any process of manufacture beyond the washed or scoured condition, not specifically provided for, were made dutiable under a combination of specific and ad valorem rates. This compound rate was applied to three classifications, based upon values, i. e., (*a*) not more than 30 cents per pound; (*b*) more than 30 and not more than 40 cents per pound; (*c*) above 40 cents per pound. Imports were not specifically recorded in statistics.

The act of 1894 provided for "roving, roping, or tops," and recorded imports averaged per annum during the life of this act 3,596,884 pounds, valued at $1,190,760. The rate of duty was 20 per cent ad valorem. Imports of these articles, which had probably been negligible theretofore, increased to 5,662,953 pounds in the fiscal year 1897.

The act of 1897 provided for "wool and hair which have been advanced in any manner or by any process of manufacture beyond the washed or scoured condition" and levied compound rates of duty based on value classifications of (*a*) not more than 40 cents per pound, (*b*) above 40 and not above 70 cents a pound, and (*c*) over 70 cents a pound. During the life of the act of 1897 the equivalent ad valorem rate averaged 101.17 per cent, and the average annual imports were only 1,434 pounds, valued at $1,211.

The act of 1909 provided for "combed wool or tops," and "wool and hair which have been advanced in any manner or by any process of manufacture beyond the washed or scoured condition," and levied compound rates of duty based on value classifications of (*a*) not more than 20 cents a pound and (*b*) more than 20 cents a pound. During the life of the act of 1909 the equivalent ad valorem rate

averaged 104.34 per cent, and the average annual imports were only 1,855 pounds, valued at $987.

The act of 1913 carried greatly reduced rates, and duties were assessed on an ad valorem basis. For the first time, a distinction was made between products of wool and camel's hair, and products of the Angora goat, alpaca, and other like animals. On "combed wool or tops and roving or roping made wholly or in part of wool or camel's hair, and on other wool and hair which have been advanced in any manner or by any process of manufacture beyond the washed or scoured condition" the rate was 8 per cent ad valorem, and on "tops made from the hair of the Angora goat, alpaca, and other like animals" the rate was 20 per cent ad valorem. Under the stimulus of the lower duties, imports jumped to 6,180,632 pounds, valued at $2,944,356, in the first year (the calendar year 1914). This increase was followed by a decline during the war period, but in 1919 there was again an increase, and in the calendar year 1921 occurred the record of 15,389,644 pounds, valued at $10,298,562. That this exceptional import was probably due to the anticipation of higher rates is shown by the fact that 15,360,231 pounds of it came in during the period from January 1 to May 27 and only 29,413 pounds during the period from May 28 to December 31, 1921.

During the life of the act of 1913, with raw wool on the free list, annual imports averaged 3,471,387 pounds, valued at $2,241,195, and the equivalent ad valorem rate of duty was 8.66 per cent. Under the emergency tariff act, when raw wool was dutiable, annual imports averaged 833,141 pounds, valued at $806,692, and the equivalent ad valorem rate of duty was 54.87 per cent.

The act of 1922 provides for "Wool, and hair of the kinds provided for in this schedule, which has been advanced in any manner or by any process of manufacture beyond the washed or scoured condition, including tops, but not further advanced than roving," at 33 cents a pound and 20 per cent ad valorem. Imports during the period September 22 to December 31, 1922, amounted to 1,207,051 pounds, valued at $693,010; during the calendar year 1923 to 3,980,450 pounds, valued at $2,426,718, with the equivalent ad valorem duty of 74.13 per cent; and during the calendar year 1924 to 576,096 pounds, valued at $429,126, with the equivalent ad valorem duty of 68.76 per cent. The rates under the act of 1922 are lower than those levied by the acts of 1897 and 1909 but higher than those levied under the acts of 1894, 1913, and the emergency tariff act of 1921.

Rates of duty.—The average rates of duty—equivalent ad valorem—on wool tops, yarns, and woven fabrics in the tariff acts from 1890 to 1922 are shown as follows:

TABLE 18.—*Equivalent ad valorem rates of duty, acts of 1890–1922*

Tariff act	Tops [1]	Yarns	Woven fabrics [2]
	Per cent	*Per cent*	*Per cent*
1890	(3)	105.11	99.42
1894	20.00	38.09	48.71
1897	101.17	93.54	100.49
1909	104.34	86.12	98.00
1913 [4]	8.66	19.36	35.26
1921 (emergency tariff act)	54.87	59.09	59.20
1922 (calendar year 1923)	74.13	67.34	73.32

[1] Includes roving and other partial manufactures.
[2] Including all woven fabrics of the kinds now dutiable under paragraphs 1108 and 1109 of the tariff act of 1922.
[3] Not recorded.
[4] Not including emergency tariff act.

It will be noticed that under the acts of 1897, 1909, and 1922 the equivalent ad valorem duty on tops was higher than on yarns and woven fabrics into which they are made, but lower under the acts of 1894, 1913, and the emergency tariff act. Under all acts, with the exception of the act of 1890, the duty on yarns was less than the duty on woven fabrics.

TABLE 19.—*Tops, roving, and other partial manufactures of wool, mohair, alpaca, etc.—Rates of duty*

Act of—	Par.	Tariff classification or description	Rate of duty
1883	362	* * * all manufactures of wool of every description, made wholly or in part of wool, not specially enumerated or provided for in this act, valued at—	
		Not exceeding 80 cents per pound	35 cents per pound and 35 per centum ad valorem.
		Above 80 cents per pound	35 cents per pound and 40 per centum ad valorem.
1890	390	Wools and hair of the camel, goat, alpaca, or other like animals, in the form of roping, roving, or tops, and all wool and hair which have been advanced in any manner or by any process of manufacture beyond the washed or scoured condition, not specially provided for in this act, shall be subject to the same duties as are imposed upon manufactures of wool not specially provided for in this act.	
	392	* * * all manufactures of every description made wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals, not specially provided for in this act, valued at—	
		Not more than 30 cents per pound	33 cents per pound and 40 per centum ad valorem.
		More than 30 and not more than 40 cents per pound	38½ cents per pound and 40 per centum ad valorem.
		Above 40 cents per pound	44 cents per pound and 50 per centum ad valorem.
1894	279	* * * and on wool of the sheep, hair of the camel, goat, alpaca, or other like animals, in the form of roving, roping, or tops.	20 per centum ad valorem.
1897	364	Wool and hair which have been advanced in any manner or by any process of manufacture beyond the washed or scoured condition, not specially provided for in this Act, shall be subject to the same duties as are imposed upon manufactures of wool not specially provided for in this Act.	
	366	* * * and all manufactures of every description made wholly or in part of wool, not specially provided for in this Act, valued at—	
		Not more than 40 cents per pound	33 cents per pound and 50 per centum ad valorem.
		Above 40 cents per pound and not above 70 cents per pound	44 cents per pound and 50 per centum ad valorem.
		Over 70 cents per pound	44 cents per pound and 55 per centum ad valorem.
1909	375	On combed wool or tops, made wholly or in part of wool or camel's hair, valued at—	
		Not more than 20 cents per pound	24¾ cents per pound and 30 per centum ad valorem.
		More than 20 cents per pound	36⅔ cents per pound and 30 per centum ad valorem.
	376	Wool and hair which have been advanced in any manner or by any process of manufacture beyond the washed or scoured condition, not specially provided for in this section, shall be subject to the same duties as are imposed upon manufactures of wool not specially provided for in this section.	
1913	286	Combed wool or tops and roving or roping made wholly or in part of wool or camel's hair, and on other wool and hair which have been advanced in any manner or by any process of manufacture beyond the washed or scoured condition, not specially provided for in this section.	8 per centum ad valorem.
	306	Tops made from the hair of the Angora goat, alpaca, and other like animals.	20 per centum ad valorem.

TABLE 19.—*Tops, roving, and other partial manufactures of wool, mohair, alpaca, etc.—Rates of duty*—Continued

Act of—	Par.	Tariff classification or description	Rate of duty
1921[1]...	19	Wool and hair of the kind provided for in paragraph 18,[2] when advanced in any manner or by any process of manufacture beyond the washed or scoured condition, * * *	45 cents per pound in addition to the rates of duty imposed thereon by existing law.
1922....	1106	Wool, and hair of the kinds provided for in this schedule, which has been advanced in any manner or by any process of manufacture beyond the washed or scoured condition, including tops, but not further advanced than roving.	33 cents per pound and 20 per centum ad valorem.

[1] Emergency tariff act, May 27.
[2] Wool, commonly known as clothing wool, including hair of the camel, Angora goat, and alpaca, but not such wools as are commonly known as carpet wools.

COURT AND TREASURY DECISIONS

Under the act of 1883, scoured wool in the form of tops torn up in order to be imported as waste was held not classable as waste or as manufactures of wool, but was dutiable at the rates imposed upon scoured wool as compared with unwashed wool with the additional duties imposed upon wools changed in character or condition for the purpose of evading duty. "Waste" was defined as "refuse, or material that is not susceptible of being used for the ordinary purpose of manufacture." (Patton *v.* United States, 159 U. S. 500, of 1895; also Juillard *v.* Magone, 37 Fed. 857, of 1889.)

This case was followed by the Board of General Appraisers in classifying wool tops, designedly broken and not incidentally produced as refuse in the process of wool manufacture, under paragraph 279 of the act of 1894 as wool in the form of tops, and not under paragraph 685 as wool waste. (G. A. 4050, T. D. 18737, of 1897.)

Wool tops, imported with a scouring machine to be used for covering the top rollers thereof and not an essential part of the machine, are dutiable as wool tops and are not to be considered with the machine as an entirety. (Abstract 27169, T. D. 32031, of 1911.) Human hair tops were held not to come within paragraph 286, and to be dutiable under paragraph 385 of the act of 1913 as unenumerated manufactured articles. (Abstract 38842, and T. D. 36200, of 1915.)

Cashmere tops and cashmere cardings were held dutiable under paragraph 286 of the act of 1913 and not under paragraph 306 of that act (Abstracts 46267 and 46475), following United States *v.* Tattersfield (11 Ct. Cust. Appls. 492), in which it was held that the soft silky undergrowth on the Chinese Cashmere goat more nearly resembled "wool of the sheep, hair of the camel" than "hair of the Angora goat, alpaca," and was therefore exempt from duty under paragraph 650 of the act of 1913 and not dutiable under paragraph 305.

Crêped wool made from wool tops by a number of manufacturing processes, including dyeing, crimping, and braiding on two cotton cords, and used as material in the manufacture of hair rolls, doll wigs, and theatrical wigs and mustaches, was held to be too far advanced to be classified under paragraph 286 of the act of 1913 as combed wool

[illegible] or roping or wool advanced beyond the washed or scoured condition, and to have become a manufacture of wool under paragraph [illegible] (Muenstaedt, Inc., *v.* United States, 12 Ct. Cust. Appls. [illegible] T. D. 39537.) Merchandise known variously as curly mohair, curled mohair, and curly mohair tops, made from mohair tops by various manufacturing processes, including dyeing and curling, was held to be too far advanced to be classified as mohair tops under paragraph 306 of the act of 1913 and to be dutiable as a manufacture of mohair under paragraph 308. (Same *v.* Same, T. D. 39539.)

Wool which has been carbonized, the purpose and effect of the carbonizing being only to free it from such substance as burrs, grass, and weeds, has been held not to be taken beyond the provision of paragraph 1102 of the act of 1922 for clean wool into that of paragraph 1106 for advanced wool. (United States *v.* Stone, 12 Ct. Cust. Appls. [illegible] T. D. 40296, of 1924.)

SECTION 2

YARNS OF WOOL, MOHAIR, ALPACA, ETC.

General Information

Tariff Act of September 21, 1922

PAR. 1107. Yarn, made wholly or in chief value of wool, valued at not more than 40 cents per pound, 24 cents per pound and 30 per centum ad valorem; valued at more than 40 cents but not more than $1 per pound, 36 cents per pound and 40 per centum ad valorem; valued at more than $1 per pound, 36 cents per pound and 40 per centum ad valorem.

DOMESTIC PRODUCTION

The yarns included in this paragraph are those made wholly or in chief value of wool of the sheep, or of hair of the camel, Angora goat, Cashmere goat, alpaca, or other like animals. The principal types are woolen and worsted yarns. Practically all woolen and most of the worsted yarns consumed in this country are produced by domestic manufacturers. A small percentage of the worsted yarn used is imported, and a relatively small quantity of the yarn made here is made from imported tops.

Description and uses.—In the wool textile industry two distinct branches are recognized by those directly engaged, but have little or no significance to the general public. These are the "woolen" and "worsted" industries. In general, the word "worsted" is little known to the consuming public, and the word "woolen" is often indiscriminately applied to all fabrics made of wool.

Woolen yarns are made from raw wool of the general class known as clothing wool, or from raw wool mixed with shoddy, with wool waste or with cotton. When these yarns are made of a mixture of wool and cotton they are known to the trade as "merino yarns." Woolen yarns, being carded only, have a fuzzy surface, a softness to the touch, and a fullness of appearance not characteristic of worsted yarns, and are adapted to the making of fulled fabrics. Woolen cloths are usually thicker and of greater body than worsted cloths.

In lightweight woolens the fibers are often raised by a teazeling process to give a napped surface. Typical woolens are billiard cloths, broadcloths, beavers, kerseys, meltons, cheviots, tweeds, doeskins, cassimeres, and blankets.

Worsted yarns are made from raw wool known as combing wool. The wool is usually carded and then combed; the combing process removes the shorter fibers (noils). The remaining fibers, being of about the same length and parallel to each other, are worked into a thick strand and then formed into a ball-shaped article called a wool top. A number of wool-top strands are passed together through many processes, which combine and draw out the fibers, the final result being a single strand of a size that can be spun into the yarn desired. The arrangement of the fibers, as well as the methods employed in the manufacture of worsted yarns, tends to produce smoother, harder twisted yarns than does the woolen-yarn process. Worsted yarns therefore produce a fabric that has a weave structure more sharply defined and a smoother surface than the customary woolen fabric. Typical worsteds are such fabrics as serges, clays, and gabardines.

Large quantities of woolen and worsted yarns are also used in the manufacture of furniture upholstery, carpets, rugs, hosiery, and other knit goods, and smaller amounts are consumed in making woven felt, and in silk and cotton goods mixed with wool yarns.

Mohair yarns are employed in the manufacture of dress goods, coat linings, light coatings, shawls, scarfs, braids, rugs and mats, button coverings, bootlaces, imitation furs, and plush. Mohair plushes are extensively employed in covering Pullman car and automobile seats and for furniture upholstery.

From the yarns made of camel's hair the production in this country is mainly of press cloth for oil milling. They are also used to some extent in making cloakings, dress goods, interlinings, and knit goods, and to a less extent for carpets and belting. Alpaca yarns are made into dress goods, linings, plushes, hosiery, and umbrella cloths. Yarns of cashmere are used in manufacturing dress goods, shawls, and hosiery.

By-products.—In the manufacture of yarns the by-products include card, top, slubbing, roving, ring, and yarn or thread wastes.

Raw materials and their sources.—The United States imports raw wool and hair chiefly from Australia, South America, the United Kingdom, New Zealand, Turkey, China, South Africa, and India. Wool tops are mainly from England, Australia, and France.

Classification of wool.—The classification of wool grades in the different wool-growing countries is not at all uniform. Chart B shows the lack of uniformity in the classification used to-day (1925) and the tentative standards suggested by the United States Department of Agriculture. It is hoped that with the general adoption of standards of terminology, the indefiniteness of the conflicting systems of nomenclature will disappear.

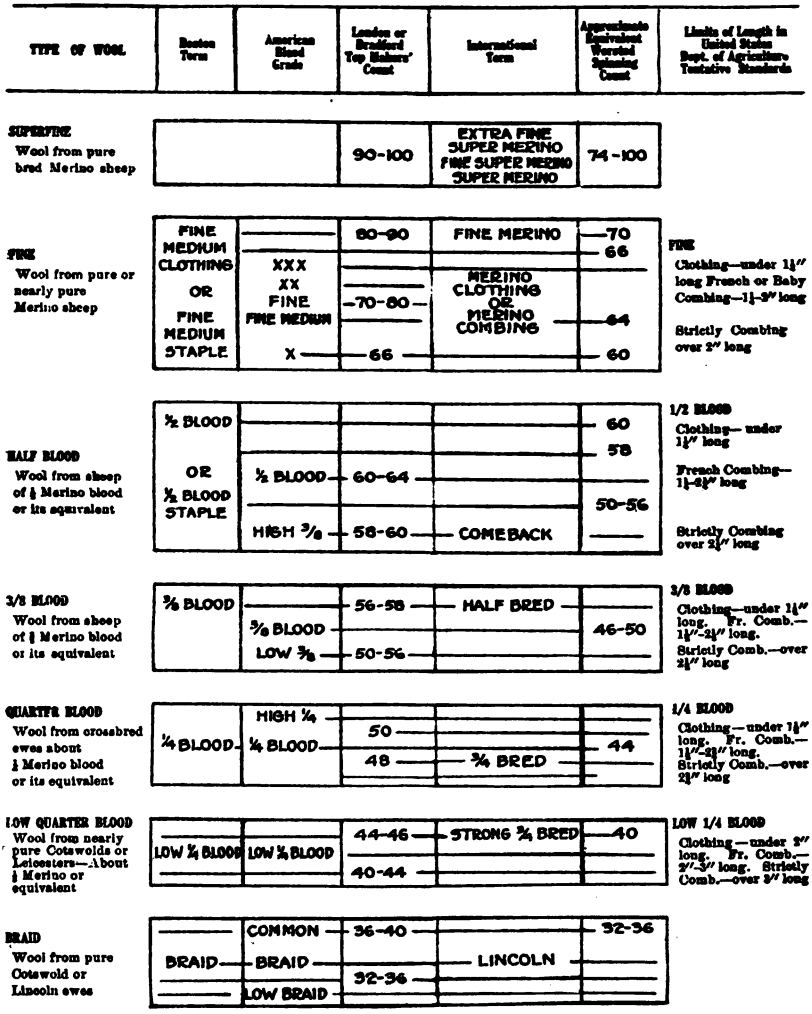

CHART B.—Approximate comparison of wool grades grouped according to system of classification

(Source: Reference book of the National Association of Wool Manufacturers, Feb. 1, 1922)

Methods of production.—Several different systems are used in converting scoured wool into yarn, the particular system employed depending on the kind of fiber used and the type of yarn desired.

Woolen yarns are made with comparatively few processes; the scoured wool is passed through woolen cards, and the roving therefrom goes direct to the woolen "mule," or to the spinning frame, for conversion into yarn. Most woolen yarn is spun on the "mule," which draws out and makes smaller the strand of fibers known as roving, twists these fibers into yarn, and winds the yarn upon a bobbin. This rather complex machine operates on the same principle as the old-fashioned spinning wheel. The winding of the yarn on the bobbin is not actually a part of the spinning, but it is a necessary operation in the process of spinning.

Spinning frames for making woolen yarn have been used to some extent for several years, but only recently has a machine been invented and perfected in this country for the continuous spinning of carded wool fibers. Earlier machines produced yarn of rather hard twist, but this new invention is said to make a wide range of soft to hard yarns. Among the advantages derived from its use, as compared with the "mule," are greater production, reduced labor costs, and extensive saving in floor space.

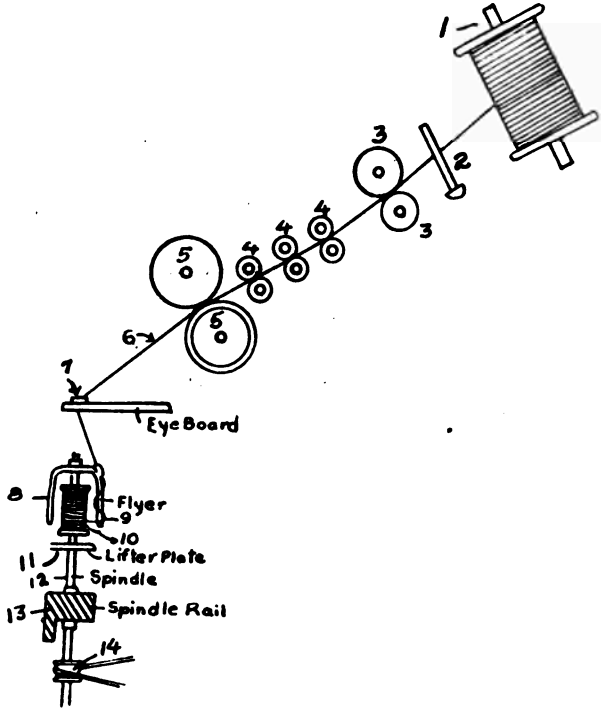

FIGURE 1.—Worsted fly spinning

3—Back rolls.	7—Yarn eye guide.	11—Bobbin lifter plate.	14—Spindle whorl.
4—Carrier rolls.	8—Flyer		

For making worsted yarns the scoured wool fiber must be subjected to carding, gilling, combing, drawing, and finishing processes, the object of which is to produce a roving whose fibers are thoroughly separated, lie parallel, and are largely freed from their curlines. After such processing the roving is ready to be spun into worsted yarn. Stated briefly, the spinning process is performed in three major operations: (*a*) Drawing out or drafting the roving; (*b*) twisting the drawn-out roving and producing a yarn; and (*c*) winding the yarn onto the bobbin. Four distinct methods are employed for these operations, (1) the flyer frame, (2) the cap frame, (3) the ring frame, and (4) the worsted mule. Each of these methods requires complicated machinery. Figure 1 illustrates the operations involved in drawing out the roving, imparting the twist, and winding the yarn upon a bobbin, by the flyer spinning frame.

... back, carrier, and front rolls,
... spindles, and lifting plates,
... down on the spindles. Bobbins
... of the frames of the machine,
... passed between the back rolls
... After the roving passes through
... front rolls. As the front rolls
... roving is drawn out and reduced
... difference between the surface speeds

... wound on the bobbin. Twist is put into the
... motion of the bobbin, the amount of twist
... upon the relation between the speed of the
... which the drafted roving is delivered from

... is especially adapted to making fine counts
... and the finer crossbred wools, and the produc-
... for the same counts, much greater than that of
... yarn is whirled around the cap at a speed of six
... volutions per minute, and as it is not protected
... on against the air causes the fibers to be raised.
... the yarn has a rough and hairy appearance,
... roughness is not apparent.

Although cap frames give greater production than flyer frames, the increased quantity produced by the former is not always advantageous, because cap-frame yarn is rougher and the percentage of flyings considerably larger than in flyer-spun yarn. Figure 2 shows how this yarn is spun.

3—Ring rail. 6—Yarn. pulley.

... spinning is employed when the French system of ... is used. In this system of drawing no twist is imparted to ... This roving is drawn out into a yarn, not by the spindle ... the woolen mule, but between two pairs of rollers, the ... revolving at a greater circumferential speed than the back ... Worsted-mule spinning has distinct advantages over frame ... in that short, weak wools which can not stand the strain ... can be spun into worsted yarn, and the yarn thus ... has a peculiar loftiness and softness which is well adapted ... soft draping dress goods and also knitted fabrics.

... kind and character of wools used, and the yarns produced ... methods of spinning described above, the following general ... may be made: The flyer is employed for producing ... yarns from mohair, alpaca, and long English wools; the cap, ... made from botany and the finer crossbred wools; the ring ... available for the production of yarns made from medium cross- ... wools, but it is chiefly used for doubling purposes; and the ... for those yarns which are produced from short-staple wools, ... particularly for dry-spun dress and hosiery yarns, in which ... and fineness are required.

Conditions under which yarns are made differ widely, depending upon the quality of the fiber and the type of product required, and, particularly for worsted yarns, there is considerable variety in the method of production.

The yarn obtained from the spinning frames and the mule has, as a rule, to undergo another operation before it is ready for manufacture.

For weaving purposes, worsted filling yarns are usually either re-wound upon special bobbins for use in the shuttle, or they are doubled and twisted and then re-wound. Warp yarns, on the other hand, pass through a number of operations before thay are ready for future use. Among the various machines employed for preparing warp yarns, the more important are winders, doublers and twisters; warpers for winding yarn onto beams; and slashers for applying size. In any case the machines used and the operations required necessarily vary with the kind of yarn and the purpose for which the yarn is intended.

Organization.—Wool-yarn manufacture is fully developed, and the yarns produced are standardized and classified under two general heads, woolen yarn and worsted yarn. Woolen yarns are made largely by mills producing finished woolen fabrics, while a considerable quantity of the worsted yarn used in making finished worsted fabrics is purchased outside of the mills producing these goods.

Of the five branches into which the wool-manufacturing industry is divided by the Census Bureau, the woolen is first in the weight of yarn produced, worsted second, carpet and rug third, knit goods fourth, and woven-felt goods fifth.

In the manufacture of carpets and rugs there are used large quantities of woolen and worsted yarns. The census figures for 1919 show that about 61 per cent of these yarns required by the carpet and rug mills were spun in the establishments where consumed, while the remainder was purchased outside. Yarns required in making carpets and rugs are rarely imported, but the raw wool from which they are made is mainly of foreign origin.

According to the census figures of 1919, of the total quantity of woolen and worsted yarns consumed by the knit-goods industry, 74 per cent was purchased, and only 26 per cent was made by the knitting mills.

In the felt-goods industry the census of 1919 shows that only woolen yarns were used, and that all of them were made by the woven-felt mills where they were consumed.

The great difference in the character of yarns produced leads to wide variations in the organization of manufacturing firms. There were 65 concerns in the United States in 1921 that operated only as worsted-spinning mills, whereas the total number of woolen and worsted-weaving establishments were 814. Of the latter, woolen mills constituted approximately 60 per cent and worsted 40 per cent.

It is not possible to state the capital invested in the manufacture of woolen and worsted yarns, as many mills produce them in conjunction with other manufactured products, and the capital involved in making yarns is not separately given in statistics. In general, it is necessary to produce worsted yarns in large quantities, as small production is rarely profitable. Furthermore, worsted spinning-mill machinery is expensive, and as the cost of installation and operation

is high, considerable capital is required in the manufacture of worsted yarns.

Although the number of spindles does not necessarily indicate the quantity of yarn that can be made, for the output of a spindle varies with the kind and size of yarn to be spun, they do give a fair indication of the productive capacity. Census figures show that, between the years 1899 and 1919, the increase in the number of woolen spindles was about 9 per cent and that for worsted spindles it was 133 per cent.

Geographical distribution.—Woolen and worsted mills are widely distributed over the United States. According to the census of 1919, the leading States, in order of number of mills, were: Pennsylvania, Massachusetts, Rhode Island, Maine, Connecticut, New Hampshire, New York, New Jersey, Vermont, Wisconsin, Ohio, Virginia, Minnesota, Indiana, Tennessee, Michigan, Oregon, West Virginia, Illinois, Georgia, Kentucky, North Carolina, Maryland, California, Delaware, Iowa, Utah, Washington, Missouri, and Texas. Massachusetts, however, produces by far the largest quantity of yarns, with Pennsylvania second, and Rhode Island third.

According to the census figures for 1919 and 1921, the States producing the largest quantities of worsted and woolen yarns for sale were, in the order named: Pennsylvania, Massachusetts, Rhode Island, and New Jersey.

Tables 20 and 21 give the total number of woolen and worsted producing spindles, and the number in each of the more important producing States, for the census years 1899–1919, inclusive. The figures do not include spindles installed in knitting mills.

TABLE 20.—*Woolen and worsted producing spindles, 1899–1919*[1]

[By census years and States]

Census year	Kind of spindles [2]	Massachusetts	Pennsylvania	Rhode Island	New Jersey	New York	Maine
1899	Woolen	486,784	345,116	[3] 144,078	64,910	124,175	[3] 145,853
	Worsted	299,298	197,833	224,646	84,654	96,538	13,484
1904	Woolen	554,066	346,294	151,860	71,500	153,343	169,560
	Worsted	349,377	278,440	227,514	113,033	121,554	17,060
1909	Woolen	502,678	318,166	124,729	53,106	138,679	161,568
	Worsted	573,056	346,630	333,246	181,512	123,718	48,920
1914	Woolen	480,810	289,792	94,099	50,424	119,053	185,500
	Worsted	901,492	310,984	408,796	233,838	157,704	53,780
1919	Woolen	561,849	284,517	119,718	59,336	153,475	200,756
	Worsted	891,505	343,763	446,072	227,568	156,028	54,440

Census year	Kind of spindles	New Hampshire	Connecticut	Wisconsin	All other States	Total for United States
1899	Woolen	113,604	[3] 157,458	[3] 22,760	330,789	1,935,527
	Worsted	[4] 5,600	27,438	[4] 912	30,432	980,835
1904	Woolen	178,630	167,021	28,438	348,684	2,169,416
	Worsted	43,424	20,960	4,120	14,123	1,189,605
1909	Woolen	115,600	168,536	25,974	302,930	1,911,966
	Worsted	61,924	24,920	6,760	49,760	1,750,446
1914	Woolen	131,408	155,867	21,188	297,328	1,825,469
	Worsted	69,772	23,836	4,208	60,744	2,225,154
1919	Woolen	143,571	207,377	26,026	354,308	2,110,933
	Worsted	75,066	20,144	4,208	64,360	2,283,154

[1] Does not include doubling and twisting spindles, or spindles employed in the knit-goods industry.
[2] Woolen spindles include those used in shoddy manufacture.
[3] A few spindles in felt mills for which separate figures are not available are included in the figures for "All other States."
[4] Worsted spindles in worsted mills for which separate figures are not available are included in the figures for "All other States."

Table 21, derived from Table 20, gives the total number of woolen and worsted producing spindles used in wool manufactures, by States and census years, 1899 to 1919:

TABLE 21.—*Combined woolen and worsted producing spindles used in wool manufactures, 1899–1919* [1]

State	1899	1904	1909	1914	1919
Massachusetts	786,082	903,463	1,075,734	1,382,302	1,453,354
Pennsylvania	542,949	624,734	664,796	600,776	628,289
Rhode Island	368,724	379,374	457,975	502,895	565,790
New York	220,713	274,897	262,397	276,757	309,503
New Jersey	149,564	184,533	234,618	284,262	286,904
Maine	159,337	186,620	210,488	239,280	255,196
Connecticut	184,896	187,981	193,456	179,703	227,521
New Hampshire	119,204	222,054	177,524	201,180	218,637
Wisconsin	23,672	32,558	32,734	25,396	30,234
Other States	361,221	362,807	352,690	358,072	418,668
Total	2,916,362	3,359,021	3,662,412	4,050,623	4,394,087

[1] Does not include the spindles employed in the knit-goods industry.

The above table shows that woolen and worsted spindles, taken together, increased 50.7 per cent from 1899 to 1919. In 1919 the mills in Massachusetts contained about 31 per cent of the total, Pennsylvania and Rhode Island 14 per cent each, New York 7 per cent; and the other States in the order named were New Jersey, Maine, Connecticut, New Hampshire, and Wisconsin.

Of the three leading wool-manufacturing States, the figures in Table 21 show an increase of about 15 per cent in the number of woolen-producing spindles in Massachusetts in 1919 compared with 1899, and a decrease of 17 per cent in the States of Pennsylvania and Rhode Island. On the other hand, the number of worsted-producing spindles greatly increased during this period, in Massachusetts increasing 199 per cent; in Pennsylvania, 74 per cent; and in Rhode Island, 99 per cent. For the entire United States, the increase in woolen-producing spindles in 1919, over 1899, was approximately 9 per cent, whereas the worsted-producing spindles increased 133 per cent. These figures indicate that a much greater increase took place in the production of worsted than of woolen yarns between 1899 and 1919.

Productive capacity of spindles.—As previously stated, the number of spindles gives a fair indication of the yarn that can be produced, but the actual operation of these spindles is probably a better criterion of yarn production. The activity of the spindles varies greatly, however, according to the kind of yarn required by the manufacturers and the character and quantity of cloths demanded by the ultimate consumer. The figures in Table 22 show the percentage of the total woolen and worsted spindles, as reported by the census, that were active in each month during 1924, and the average percentage for the years 1919 to 1924, inclusive.

TABLE 22.—*Percentage activity of the total woolen and worsted spindles in operation, 1919–1924*

Year and month	Active spinning spindles [1]	
	Woolen	Worsted
1924	*Per cent*	*Per cent*
January	80.9	73.3
February	82.4	77.6
March	84.4	78.0
April	82.2	71.9
May	79.3	64.6
June	78.0	58.4
July	74.0	54.8
August	72.9	58.2
September	79.3	66.5
October	83.3	75.4
November	83.0	77.3
December	84.0	75.3
Yearly average	80.3	69.3
Average for year:		
1919	83.3	79.0
1920	67.4	74.1
1921	71.8	83.9
1922	82.8	77.9
1923	85.8	87.8
1924	80.3	69.3

[1] Ratio of machinery hours that the mills ran to single-shift capacity machinery hours. Since the normal basis of mill activity is less than single-shift capacity, these percentages are much lower than they would be if they represented the activity of the industry with relation to normal.

A comparison of the figures given in Table 22 indicates that in 1919 woolen spindles were in slightly greater demand. In 1920 both industries were less active than they were the year before, with worsted spindles in relatively greater use. The worsted spindles were more active than the woolen spindles in 1921, and both industries showed greater activity than in 1920. In 1922 the woolen spindles were more in demand than the worsted, although only to a small extent. Both branches were very active in 1923, with the worsted spindles in slightly greater use. During the year 1924 there was a considerable falling off in the activity of the worsted spindles and a slight decrease for woolen spindles. With the exception of January, 1919, and December, 1920, the month of lowest activity recorded for worsted spindles was July, 1924, when the average was only 54.8 per cent.

Yarn numbering.—Yarns of wool or hair are numbered according to their respective systems of manufacture; the number of a yarn indicates its approximate size as well as designates the number of yards in 1 pound. The terms or units used in the United States for the three well-known methods of numbering are the "run," the "cut," and the "count."

In the United States (except in and near Philadelphia) woolen yarns are numbered on the basis of the number of "runs" of 1,600 yards that weigh 1 pound. By this system 1 pound of 1-run yarn contains 1,600 yards, 1 pound of 2-run yarn contains 3,200 yards, 1 pound of 3-run yarn contains 4,800 yards, and so on. The finer the yarn the higher the number of the yarn. A 1 or 2 run yarn is coarse and used in overcoatings, blankets, and cotton-warp goods, where most of the weight is furnished by the filling; 3½ to 4 run yarns are medium yarns; and 6½ to 8 runs yarns are considered fine yarns.

According to the "cut" system of numbering woolen yarns, 1 pound of 1-cut yarn contains 300 yards, 1 pound of 2-cut yarn contains 600 yards, 1 pound of 3-cut yarn contains 900 yards, etc. In other words, the number of yards in a pound, by this system of numbering, is always 300 times the number designated by the "cut." Coarse yarns have the lower numbers, and as the yarn increases in fineness the number of the cut becomes higher. A 5-cut yarn is coarse, 18 to 21 cut is medium, and 30 to 35 cut is fine.

In the United States and in the United Kingdom worsted yarns are numbered on the basis of the number of hanks of 560 yards to the pound. No. 1 worsted yarn measures 560 yards to the pound; No. 30 worsted yarn measures 30 times 560, or 16,800 yards; No. 60 worsted yarn measures 33,600 yards, etc. Low numbers or counts of worsted yarn are seldom quoted on the market, but when quoted, they are usually known as roving yarns and used in knitting very heavy sweaters. The size or number of worsted yarn is commonly written as 30s, 40s, 50s, etc. Counts under 30s are considered comparatively coarse, 30s to 50s are medium, and above 50s are fine. Counts above 80s are not common.

In the manufacture of woolen cloths single yarns are more generally employed, whereas in the production of worsted cloths the bulk of the yarns used are probably two-ply. Considerable quantities of worsted cloths, however, are made with either single, two or more ply, or both single and ply yarns. A single yarn is an individual thread, and a two-ply yarn is one that has two threads twisted together. A 50s two-ply yarn is written 2–50s, or 2/50s.

Woolen yarns are usually consumed where they are made, and therefore the trade in them is small; worsted yarns, on the other hand, are produced for sale in large quantities. The worsted yarns sold in greatest quantities are probably 2–32s, 2–40s, and 2–50s for men's wear and dress goods; 2–18s, 2–20s, 2–28s, and 2–30s for sweaters, bathing suits, and other knit goods; and 1–20s, 1–30s, 1–40s, and 1–50s for knit and dress goods.

Mohair, alpaca, and similar yarns are usually made, numbered, and sold in the same way as worsted yarns.

In Germany and France the metric system of numbering worsted yarn is in common use, and this method is usually employed when such yarn is offered for sale in other countries. The metric system is based on the number of lengths of 1,000 meters weighing 1 kilogram, equivalent to the number of 496-yard lengths weighing 1 pound. To reduce the metric number to the equivalent number as used in the United States, multiply by 0.886, and to convert the United States number into the equivalent metric number, multiply by 1.129. For example: No. 60 metric number $\times 0.886 =$ No. 53.1 United States worsted yarn number; and conversely, No. 60 United States number $\times 1.129 = 67.7$ metric yarn number. See Table 44 (p. 63), in Appendix for comparable yarn sizes, with corresponding yards per pound, covering the full range of worsted and woolen yarns and comparable sizes of cotton yarn.

Domestic production and consumption.—The manufacture of woolen and worsted yarns is shown in statistics under five distinct headings, classified by industries, as: Woolen, worsted, carpets and rugs, felt goods, and knit goods. Mohair yarns are considered as worsted yarns and are included as such in the following tables.

Yarns which are made of a mixture of wool and cotton fibers, to be included under paragraph 1107, must be in chief value of wool. Statistics, however, do not show the value of wool contained in these yarns, and they are, therefore, not included in the figures shown in Tables 23 and 24. Large quantities of these yarns are used in the woolen, worsted, and knit-goods industries, and a study of the 1919 statistics show that the total consumption was about 70,000,000 pounds, with a probable value of more than $75,000,000. The quantity, 70,000,000 pounds, includes both yarns used in the mills where they were made, and the amount purchased.

Domestic production of woolen and worsted yarns for all purposes was reported by the Bureau of the Census as set forth in Table 23.

TABLE 23.—*Total production of woolen and worsted yarns made in woolen, worsted, felt, carpet, and knit goods mills, 1909–1919*

Yarn	1909	1914	1919
	Pounds	*Pounds*	*Pounds*
Woolen	170, 763, 843	205, 629, 111	232, 477, 278
Worsted	[1] 183, 940, 695	[2] 182, 944, 184	[3] 144, 334, 246
Total	354, 704, 538	388, 573, 295	376, 811, 524

[1] Includes 869,968 pounds of mohair yarn.
[2] Includes 8,844,234 pounds of mohair yarn.
[3] Includes 1,349,359 pounds of mohair yarn.

TABLE 24.—*Production of woolen and worsted yarns in woolen and worsted mills, 1914 and 1919, and yarn for sale in 1923*

Yarn	For sale	For use in same establishment		Total
		Woolen mills	Worsted mills	
Woolen—	*Pounds*	*Pounds*	*Pounds*	*Pounds*
1923	49, 577, 202	(1)	(1)	49, 577, 202
1919	28, 959, 769	147, 232, 110	18, 207, 724	194, 399, 603
1914	26, 830, 047	118, 309, 523	10, 400, 722	155, 540, 292
Worsted—				
1923	[2] 113, 467, 590	(1)	(1)	113, 467, 590
1919	[3] 75, 735, 205	1, 113, 759	61, 350, 377	138, 199, 341
1914	[4] 95, 843, 039	1, 271, 374	74, 629, 697	171, 744, 110

[1] Not recorded.
[2] Includes mohair yarn, but the quantity is not shown in statistics.
[3] Includes 1,349,350 pounds of mohair yarn.
[4] Includes 8,844,234 pounds of mohair yarn.

Table 25 gives the quantity, by industries, of the woolen and worsted yarns consumed in the mills making them, and also the amount purchased. These two quantities added together give the approximate consumption for the year 1919.

TABLE 25.—*Consumption of woolen, worsted, and mohair yarns, 1919*

Consuming industry	Consumed where made	Purchased	Total consumption
	Pounds	*Pounds*	*Pounds*
Woolen industry:			
Woolen yarn	147,232,110	2,172,487	149,404,597
Worsted yarn	1,113,759	6,189,297	7,303,056
Worsted industry:			
Woolen yarn	18,207,724	3,909,077	22,116,801
Worsted yarn	61,350,377	39,053,028	100,403,405
Carpet and rug industry:			
Woolen yarn	28,121,404	17,389,590	45,510,994
Worsted yarn	5,602,211	4,164,565	9,766,776
Knit-goods industry:			
Woolen yarn	5,861,147	5,383,926	11,245,073
Worsted yarn	532,694	12,635,631	13,168,325
Felt goods: Woolen yarn	4,095,124	Not given.	4,095,124
Silk industry: Woolen and worsted yarns	None.	[1] 1,210,388	1,210,388
Cotton industry:			
Woolen yarn	None.	115,339	115,339
Worsted yarn	None.	313,061	313,061
Total:			
Woolen yarn	203,517,509	28,970,419	232,487,928
Worsted yarn	68,599,041	62,355,582	132,165,011
Grand total	272,116,550	91,326,001	364,652,939

[1] Includes 572,054 pounds of mohair and 638,334 pounds of woolen and worsted yarns.

As shown in Table 25, the consumption of woolen yarns in 1919 was 232,487,928 pounds and of worsted yarns 132,165,011 pounds. The latter figure includes 1,210,388 pounds of woolen, worsted, and mohair yarns used in the silk industry, and of this quantity the worsted yarns employed greatly predominate.

The value of woolen and worsted yarns can not be stated, as apparently 75 per cent of these yarns are used in the mills where they are produced. The 91,326,001 pounds of yarn purchased, however, were shown by statistics to be valued at $200,483,622 in 1919.

Of the total woolen yarns manufactured, those produced for sale amounted to approximately 18 per cent in 1909 and 13 per cent both in 1914 and in 1919. Of the total worsted yarns manufactured those produced for sale amounted to approximately 49 per cent in 1909, 52 per cent in 1914, and 53 per cent in 1919. For these three census years, therefore, about 85 per cent of the yarns produced in the woolen industry were used by the producing mills, whereas in the worsted industry during the same years approximately only 50 per cent of the worsted yarns were used by the mills that made them.

Domestic exports.—Prior to 1922 statistics do not record exports of domestic-made yarns. In that year total exports of these yarns were 151,253 pounds, valued at $293,577. Of the total quantity, Mexico received about 34 per cent, Japan and Canada about 17 per cent each, and the remainder was exported in smaller quantities to 36 other countries. During 1923 these exports totaled 163,519 pounds, valued at $281,007, the bulk going to three countries, namely, Japan 39 per cent, Mexico 31 per cent, and Canada 8 per cent. The rest was shipped, in comparatively small amounts, to 35 other countries. For the year 1924 our exports were only 98,707 pounds, valued at $207,326. Mexico received about 42 per cent of the total quantity exported, England 11 per cent, Japan 9 per cent, and numerous countries less than 7 per cent each.

Table 26 shows the principal countries to which domestic wool yarns were exported in 1922, 1923, and 1924:

TABLE 26.—*Exports of wool yarns to principal countries, 1922–1924*

Exported to—	Quantity		Value		Average price per pound
	Pounds	Per cent of total	Dollars	Per cent of total	
1922					
Mexico	50,850	33.6	113,245	38.6	$2.23
Japan	25,250	16.7	40,240	13.7	1.59
Canada	25,170	16.6	42,410	14.4	1.68

FOREIGN PRODUCTION

The actual production of woolen, worsted, mohair, alpaca, cashmere, and similar yarns in foreign countries is not recorded in statistics. The productive capacity of woolen and worsted yarns is, however, indicated by the number of producing spindles used in their manufacture. The latest available information as to the number of such spindles in the leading manufacturing countries is shown in Table 27.

TABLE 27.—*Woolen and worsted spinning spindles, 1919–1921*

[Twisting spindles not included]

Country	Year	Worsted	Woolen	Total
United States	1919	2,903,503	2,019,553	4,923,056
United Kingdom	1918	3,609,545	3,111,085	6,720,630
Germany	1913	2,263,364	2,100,000	4,363,364
France	1922	2,292,409	679,131	2,971,540
Czechoslovakia	1920	450,000	596,000	1,046,000
Italy	1918	435,350	520,795	956,145
Belgium	1921	348,130	360,175	708,305

The above figures indicate that the United Kingdom holds first place in yarn production, the United States second, Germany third, and France fourth.

International trade in woolen, worsted, mohair, alpaca, and similar yarns by the most important countries is shown in Table 28.

TABLE 28.—*International trade in yarns of wool, mohair, etc., 1909–1924*

Year	United States	United Kingdom	Germany	France
1909:	*Pounds*	*Pounds*	*Pounds*	*Pounds*
Imports	299,254	23,985,703	53,357,493	5,001,576
Exports	(1)	74,069,900	18,555,457	20,840,966
1913:				
Imports	199,738	32,993,997	50,761,356	4,067,046
Exports	(1)	72,380,694	25,042,051	30,157,164
1922:				
Imports	4,431,619	15,797,028	31,931,426	4,065,944
Exports	160,905	49,781,193	9,657,912	26,720,634
1923:				
Imports	5,617,321	15,771,778	15,036,474	3,903,748
Exports	163,519	53,728,300	17,429,568	28,844,327
1924:				
Imports	3,120,690	17,801,344	42,728,675	2,958,012
Exports	98,707	62,241,800	16,112,980	34,978,845

[1] Not recorded.

In 1924 the distribution of the above import and export trade was largely as follows:

(1) For the United States:
Imports—From the United Kingdom, Germany, and France.
Exports—To Mexico about 43 per cent, while much smaller quantities went to the United Kingdom, Japan, Canada, Cuba, Argentina, Uruguay, Germany, etc.

(2) For the United Kingdom:
Imports—France and Belgium furnished the bulk; other countries were Switzerland, Netherlands, Germany, etc.
Exports—Germany received about 45 per cent of the total; smaller quantities were shipped to Japan, France, Netherlands, Denmark, Australia, Sweden, Norway, and lesser amounts went to a large number of other countries.

(3) For Germany:
Imports—From the United Kingdom about 25 per cent, other important countries were Belgium, Czechoslovakia, Switzerland, etc.
Exports—To Japan about 18 per cent; Sweden, 12 per cent; Switzerland, 10 per cent; Czechoslovakia, 8 per cent; China, 7 per cent, etc.

(4) For France:
Imports—Import statistics show only yarns of mohair, by countries. The total quantity amounted to 965,394 pounds, of which the United Kingdom furnished about 96 per cent. Of the total quantity of yarns of wool, mohair, alpaca, etc., imported (2,958,012 pounds), yarns of mohair constituted about 33 per cent. However, English statistics indicate that the bulk of the French imports of yarn of wool, alpaca, etc., as well as of mohair, are from England.
Exports—The Union of Belgium and Luxemburg received the largest quantity, the United Kingdom and Germany were second and third, respectively, and Japan and several other countries took the remainder in much smaller quantities.

In 1913 the United Kingdom exported 44,048,700 pounds of wool yarns to Germany, or about 87 per cent of the total German imports, and 2,603,800 pounds to France, or 64 per cent of the total French imports; its remaining exports were shipped to all parts of the world. During that year the United Kingdom imported 32,993,997 pounds, of which 32,725,381 pounds came from Belgium, France, and Germany. Of these, Belgium furnished 15,585,007 pounds, France 12,149,814 pounds, and Germany 4,990,560 pounds.

In 1913 France was second in exports of wool yarns with 30,157,164 pounds, and the proportions shipped to the more important countries were approximately as follows: United Kingdom, 50 per cent; Belgium, 16 per cent; Germany, 13 per cent; Brazil, 7 per cent; and Spain, 5 per cent.

Germany has for many years imported larger quantities of woolen, worsted, alpaca, and similar yarns than any other nation, and most of these importations came from the United Kingdom.

The United Kingdom is the largest producer not only of yarns of wool, but also of yarns of alpaca, mohair, and cashmere. Of the last three types of yarns it holds a preeminent place in production. In 1923 it exported 17,221,900 pounds, of which Germany took 12,879,300 pounds; in 1922 only 6,788,300 pounds, of which Germany took 2,866,600 pounds; and in 1923 9,587,600 pounds, of which Germany took 3,102,800 pounds.

The last census taken in the United Kingdom to ascertain the quantity of woolen, worsted, alpaca, mohair, cashmere, and similar yarns produced was in 1907, when it was shown that a total of 446,000,000 pounds were made. Of this, 260,000,000 pounds were woolen yarns; figures showing the quantities of each of the other yarns produced in that year are not available.

Japan is rapidly becoming one of the largest importers of woolen and worsted yarns; in 1923 its imports totaled 25,957,774 pounds, and in 1924, 20,786,776 pounds, as compared with 7,253,755 pounds in 1913. Its imports in this line are supplied mainly by the United Kingdom and Germany. The latest available production figures of wool yarns in Japan are for the year 1921, when about 22,000,000 pounds were manufactured.

IMPORTS

In the tariff act of 1890 all yarns made wholly or in part of wool or hair of the camel, goat, alpaca, or other animals, were grouped together and so recorded in imports for consumption statistics. The largest yearly importation during the life of this act was in the fiscal year 1893, when 1,202,450 pounds, valued at $702,920, entered this country.

The classification of yarns in the tariff act of 1894 was the same as in the previous act, but the equivalent ad valorem rate of duty was only about one-third. Imports immediately increased, and for the first six months, namely, from January 1 to June 30, 1895, inclusive, importations amounted to 2,426,687 pounds, valued at $1,096,750. During the whole period of this act the average yearly import was 2,559,350 pounds, valued at $1,242,955.

The acts of 1897 and 1909 classified yarns in the same manner as just stated above. The average equivalent ad valorem duty under these two acts, however, was about two and one-third times higher than that of the act of 1894. During the entire period of the acts of 1897 and 1909, or about 16½ years, imports were small; the largest for any one year was in the fiscal year 1902, when 381,892 pounds, valued at $199,334, were recorded.

Under the provisions of the act of 1913 these yarns were separated into two divisions as follows: (1) Those made wholly or in chief value of wool or of camel's hair, and (2) those made of the hair of the Angora goat, alpaca, or other like animals. To each of these divisions there was applied a different rate of duty. Imports for consumption statistics are tabulated according to these two classifications in Tables 29A and 29B. Combining both types of yarns, the equivalent ad valorem rate of duty for the last six months of the act of 1909 was 99.90 per cent, whereas the comparable equivalent ad valorem duty for the first six months of the act of 1913 was 18.86 per cent. Imports immediately increased, and for the first six months of the 1913 act they amounted to 3,233,284 pounds. During the last six months of the act of 1909 only 105,802 pounds had been imported. For the fiscal year 1915 imports reached a total of 3,299,404 pounds, valued at $2,313,677. Owing to the war, importations for the years 1916, 1917, 1918, and 1919 were relatively small compared with 1915. In the calendar year 1920 imports were slightly more than those recorded for the fiscal year 1915, and in 1921 they totaled 5,135,381 pounds, which was the largest reported for any one year up to that time. The emergency tariff act was enacted in 1921 and was effective from May 28, 1921, to September 21, 1922. Under this law considerably higher duties were imposed than those specified in the previous act, and these higher duties are reflected in the increased equivalent ad valorem rates for 1921 and 1922, as shown in Table 29. Imports for the entire period of this act (482 days) were 4,733,297 pounds, and the equivalent ad valorem rate was 59.09 per cent. The average imports per annum during the life of the act of 1913 and that of the emergency act was 2,413,012 pounds, and the equivalent ad valorem rate was 27.69 per cent.

By the terms of the present tariff act, which became effective on September 22, 1922, all yarns made wholly or in chief value of wool, hair of the camel, goat, alpaca, etc., are grouped together in one classification. Although the equivalent ad valorem rate is higher under the provisions of this act than it was under the emergency act, the imports for the first calendar year of its operation (1923) were the largest ever recorded for any one year. Total imports for consumption in 1924 shows a considerable decrease from 1923, the corresponding figures being 5,617,321 pounds for 1923 and 3,120,690 pounds for 1924.

Imports for consumption.—Table 29 is a summary of the total imports for consumption of yarns since the beginning of the act of 1890. Subsidiary Tables 29A and 29B show, respectively, imports of yarns of wool and camel's hair and yarns of mohair, etc., for the years that they were separately recorded in statistics.

TABLE 29.—*Total yarns of wool, mohair, alpaca, etc.—Imports for consumption—Revenue 1891–1924*

Fiscal year (unless otherwise stated)	Quantity	Value	Duty collected	Value per unit	Equivalent ad valorem rate
	Pounds				*Per cent*
1891 (Oct. 6, 1890, to June 30, 1891)	587,348	$392,793	$381,775	$0.669	97.19
1892	1,192,147	710,537	793,853	.596	111.73
1893	1,202,450	702,920	742,337	.585	105.61
1894	530,145	338,849	339,476	.639	100.18
1895 (July 1 to Dec. 31, 1894)	147,193	91,212	93,084	.620	102.05

1924 (calendar year) [4]	1,355,400	1,675,609	1,151,991	1.236	68.75

[1] Imports here shown separately are included in Table 29. Mohair and alpaca yarns were not separately recorded prior to the act of 1913.
[2] Includes 133,129 pounds, valued at $183,773, paying emergency tariff act surtax of 45 cents a pound and the regular duty of 25 per cent ad valorem.
[3] Includes 1,370,912 pounds, valued at $1,531,222, paying emergency tariff act surtax of 45 cents a pound and the regular duty of 25 per cent ad valorem.
[4] Yarns of mohair.

General imports.—The principal sources of imported wool yarns are the United Kingdom and Germany, although for certain years France has furnished considerable quantities. For the five years 1891 to 1895, inclusive, the total was almost equally divided between the first two countries. For the three years 1896 to 1898, inclusive,

imports from the United Kingdom to the United States were about twice the imports from Germany. During the next 11 years, 1899 to 1909, inclusive, the quantities coming from Germany exceeded those from the United Kingdom. For the entire 19-year period, 1891 to 1909, inclusive, imports from the United Kingdom were 6,202,907 pounds, while those from Germany totaled 5,576,945 pounds.

Imports by countries were not reported in our statistics for the years 1910, 1911, 1912, 1913, 1914, or 1915, but British statistics indicate that during these years they were mainly of British origin. Since 1915 the United Kingdom has supplied the bulk of imports in each year. In so far as figures are available, the yarns furnished each year since 1890 by the three principal countries, and the main ports through which these yarns entered this country, are shown in Tables 30 and 31.

TABLE 30.—*General imports of yarns of wool, mohair, alpaca, etc., by countries 1891–1924*

[1] From 1910 to 1915, inclusive, general imports were not officially recorded. English statistics show exports of woolen, worsted, alpaca, mohair, and cashmere yarns from the United Kingdom to the United States for specified calendar years as follows: 1910, 58,800 pounds; 1911, 36,700 pounds; 1912, 53,200 pounds; 1913, 405,800 pounds; 1914, 3,262,600 pounds; and for 1915, 864,100 pounds.

[2] July 1 to Dec. 31, 1918.

[1] Not officially reported for the years 1910 to 1915, inclusive. [2] July 1 to Dec. 31, 1918.

The above figures show that New York has always been the principal port of entry for yarns of wool, mohair, alpaca, etc.

Character of imported yarns.—Worsted yarns, of wool and of mohair, make up the bulk of imports; imports of woolen yarns are small.

The counts of worsted yarns most commonly imported in 1924 were: 1/21, 1/24, 1/26, 1/60, 2/16, 2/18, 2/20, 2/28, 2/42, 2/48, 2/60, 2/70, 2/78, 3/18, and 3/24; and of mohair and alpaca yarns 2/24, 2/28, and 2/32. The worsted yarns entered in greatest quantity were probably 1/21, 2/20, 2/48, and 2/70; mohair yarns were largely 2/28 and 2/32.

An analysis based upon 280 different importations, totaling 713,210 pounds of yarn imported through the port of New York during the first six months of 1924, gives the following results as to types and kinds: (1) Singles ranged from 13s to 100s, (2) two-ply ranged from 12s to 80s, (3) three-ply ranged from 10s to 70s, (4) four-ply ranged from 18s to 40s, (5) six-ply and eight-ply were received in two qualities for each of these types, namely, 18s, 60s, and 18s and 80s respectively. Of this 713,210 pounds of yarn, about 43 per cent was imported directly by silk manufacturers for use in the production of broad, fancy, and tie fabrics, 13 per cent was entered by plush manufacturers, the remainder was brought in by wool manufacturers and commission or importing concerns.

According to information obtained from the trade, worsted yarns imported in 1924 consisted chiefly of the following: (1) Fine yarns which require considerable labor in their production, (2) very hard twisted yarns, (3) medium fine yarns produced from low-grade wool, and (4) gassed yarns of fine quality.

According to other available information, the mills of this country are equipped to manufacture practically any kind of yarn required

by the industries, but owing to the low labor costs abroad yarns of the special types outlined above can enter the United States and be sold here below the selling prices of similar yarns made by domestic manufacturers. An unusually large percentage of labor is entailed in the production of these yarns, and the cost of making them abroad is so much less than in the United States that the domestic manufacturer can not compete with the foreign product in the American market.

Furthermore, the spinning of low grades of tops into medium fine yarns, such as 2/40s yarn from quarter-blood wool stock, is said to be uneconomical in this country. In England, and also in some of the European countries, owing to the lower wages, slower processes, the methods of manufacture employed, etc., medium fine yarns can be produced from the lower grade tops with satisfactory results, and these yarns can be imported into the United States and sold here at a profit to the foreign producer.

PRICES

Landed costs of worsted yarns invoiced at various prices.—The landed cost of an imported yarn depends upon its foreign selling price, the landing charges (buying commission, freight, insurance, etc.), and the rate of duty. For the purpose of comparing the effect of duties, levied under each of the last four tariff acts, upon the landed cost of yarns, computations were made and a tabulation of the results is shown in Table 32. Arbitrary foreign selling prices ranging from $0.65 to $1.85 a pound, were chosen as a basis for the following table which shows the total landed costs of the yarns according to the manner in which they were classified in each tariff act.

TABLE 32.—*Imported yarns of wool, camel's hair, mohair, alpaca, etc.—Effect of duties under four tariff acts, 1909–1922*

[1] Yarns of wool, camel's hair, mohair, alpaca, etc.
[2] Yarns of wool or camel's hair.
[3] Yarns of mohair, alpaca, etc.
[4] Includes buying commission, insurance, and freight, which has been added for different years as follows: 3 cents for 1909, 4 cents for 1913, and 5 cents for the emergency act and the act of 1922.

Comparison of United States prices of imported and domestic worsted yarns.—The kinds of English and American worsted yarns selected for price comparisons are given below. Column B of each type shows the quality of top used in making the count of yarn listed in column A.

TABLE 33.—*Comparable English and American worsted yarns*

English		American	
A	B	A	B
Yarn number	Quality of top used	Yarn number	Quality of top used
2/60s	70s	2/60s	70s.
2/48s	64s	2/50s	Fine.
2/40s	60s	2/40s	½ blood staple.

	Feb. 1925	.84	.654	.05	1.54	1.62	1.45

[1] Prices obtained from Wool Record and Textile World and N. B. K. Brooks, of Boston, Mass. The English prices were converted into United States currency at par for 1914; for 1924, at the rate of exchange on May 15, and for 1925, at the rate of exchange on Feb. 5.
[2] Includes freight, insurance, and commission charges.
[3] Includes 5 per cent on landed cost for importer's overhead and profit.
[4] Prices obtained from American Wool and Cotton Reporter.

The figures in the previous table tend to show that the United Kingdom can compete on the American market only in certain kinds of yarn, in so far as prices are concerned, but that the United States can not compete with the United Kingdom in the world markets. When domestic mills buy direct from foreign sources, the total landed cost of English yarns must be the basis of comparison with American selling prices.

A comparison of the domestic and English worsted-yarn prices quoted in Table 34 shows that the selling price in the United States was considerably higher than the selling price of a comparable English yarn in England for the dates mentioned in 1914, 1924, and 1925. The higher selling prices in the two countries in 1924 and 1925, as compared with 1914, were due primarily to the higher prices of raw wool and tops, and to the greater manufacturing costs, including higher wages based on increased living costs. The variation in the rate of increase for different qualities of yarns was caused mainly by the quantity available, the demand, and the price variation in the particular grades of raw wool and tops required. Table 35 shows that the percentage increase in the selling prices in 1924 over 1914 for English yarns in England and comparable American yarns in the United States was as follows:

TABLE 35.—*Increase in selling prices of yarns, 1914–1924*

Type of yarn	English yarn in England	American yarn in United States	Difference in rate of increase
	Per cent increase	*Per cent increase*	*Per cent*
2/60s	109.2	147.8	38.6
2/48s	91.3	130.4	39.1
2/40s	97.3	133.7	36.4
2/32s	87.5	135.6	48.1
2/36s	90.9	125.0	34.1
2/20s	91.2	120.0	28.8
2/24s	52.3	107.7	55.4
Average	88.5	128.6	40.1

The fact that the domestic product can not compete with the English product in foreign markets is emphasized by the size of our domestic exports, which for the year 1924 amounted to only 98,707 pounds.

Trend of prices, 1913–1925.—Table 36 gives the range of market prices of four standard domestic worsted yarns as quoted on January 1 of each year since 1913, and a comparison with the index number of all commodities.

TABLE 36.—*Comparison of wholesale prices per pound of four standard domestic worsted weaving yarns, 1913–1925*

January 1—	Prices per pound of domestic yarns [1]						Index number of all commodities
	Number and quality				Average price	Relative price (1913 basis)	
	2/24s, ¼ blood	2/36s, ¼ blood	2/40s, ½ blood	2/50s, fine medium			
1913	$0.75	$0.95	$1.00	$1.15	$0.96	100	100
1914	.60	.80	.90	.95	.81	84	98
1915	.70	.90	1.00	1.10	.93	97	101
1916	.90	1.00	1.25	1.35	1.13	118	127

1925	1.65	2.00	2.40	2.75	2.20	229	160

[1] Wholesale prices of worsted yarns were obtained from bulletins of the National Association of Wool Manufacturers.
[2] Index numbers of all commodities as published by the Bureau of Labor Statistics, United States Department of Labor.

The relative price figures for worsted yarns show that on January 1 they were lower than the general market level for all commodities in 1914, 1915, 1916, and 1917, considerably higher in 1918, 1919, and 1920, slightly above in 1921 and 1922, but much higher in 1923, 1924, and 1925. On January 1, 1925, the average price of the four yarns cited above was 2.29 times the price on January 1, 1913. The wide variation in yarn prices reflects the great fluctuations throughout the world in the prices of raw wool.

The extent to which the above yarn prices are affected by raw wool coming into this country free of duty or dutiable can not be stated. However, in 1913 raw wool was dutiable; from January 1, 1914, to May 28, 1921, it was duty free; and since the last-mentioned date it has been dutiable.

COMPETITIVE CONDITIONS

The costs of producing worsted yarns are lower in England and continental Europe than in the United States, but as to the exact relation of production costs in the various countries there is little available information.

In England and upon the Continent the worsted-yarn business is largely divided between the yarn merchant, who owns the combed wool or tops, and the commission spinner, who spins the worsted yarns for a fixed fee per quantity for the yarn merchant. In the United States a greater percentage of these yarns are made in the establishments in which they are later consumed in the manufacture of cloth than is the case abroad. The production of worsted yarns for sale is therefore relatively larger abroad than in the United States, although according to the census of 1919 worsted yarns for sale in this country amounted to about 50 per cent of the total quantity manufactured.

Imports during the fiscal year 1914 were less than 1 per cent of the total domestic production of woolen and worsted yarns; in the calendar year 1919 they were less than one-tenth of 1 per cent. Practically all imports are worsted yarns (this includes mohair yarns), and may therefore be compared with domestic production. In 1914 imports constituted 1.8 per cent, and in 1919 only 0.26 per cent of the domestic production of worsted yarn. Taking the 1919 domestic production as a basis for computation, the 1923 imports of worsted yarns constituted about 4 per cent of the probable domestic production, and 1.5 per cent of the total woolen and worsted yarns made in the United States. With a total domestic production in 1923 of probably 400,000,000 pounds of woolen, worsted, mohair, alpaca, and other similar yarns mentioned herein, and 6,336,224 pounds of these yarns imported during the year, it is evident that there is relatively little foreign competition on the American market. Imports in 1924 totaled 2,916,206 pounds, which was less than half the quantity imported in 1923.

TARIFF HISTORY

Under the provisions of the tariff act of 1890, all yarns made wholly or in part of wool, or of hair of the camel, goat, alpaca, or other like animals, were dutiable under a combination of specific and ad valorem rates. This compound rate was applied to three classifications of yarn values, namely, (*a*) not more than 30 cents per pound; (*b*) more than 30 cents but not more than 40 cents per pound; (*c*) more than 40 cents per pound. The actual and computed ad valorem rate averaged 105.11 per cent per annum for the entire period of this act. This equivalent ad valorem duty was higher than that applied under any subsequent act. The average annual imports during the life of the act of 1890 were 862,815 pounds. valued at $527,296.

In the act of 1894 the descriptive wording was the same as in the previous act, but the rates were made ad valorem only and were applied to two classifications of yarn values, namely, (*a*) not more than 40 cents per pound, and (*b*) more than 40 cents per pound. The equivalent ad valorem duty averaged 38.09 per cent per year during the life of this act, this being the second lowest for the last 34 years. Imports immediately increased and the average annual imports for the period during which this act was in force was 2,559,350 pounds, valued at $1,242,955.

In the act of 1897 the rates were changed back to specific and ad valorem and were applied to two classifications of yarn values, namely, (*a*) not more than 30 cents per pound, and (*b*) more than 30 cents per pound. During the period of this act the equivalent ad valorem duty averaged 93.54 per cent per year, and the average annual imports were only 239,002 pounds, valued at $157,620.

The provisions of the act of 1909 were identical with those of 1897, except that the ad valorem rate for yarns valued at not more than 30 cents per pound was reduced 5 per cent. Thus, the equivalent ad valorem duty was slightly lowered to an annual average of 86.12 per cent. The yearly average imports during the life of this act were 197,018 pounds, valued at $164,141, the lowest ever recorded.

Under the act of 1913 straight ad valorem rates were again applied. and yarns were classified into two divisions: (1) Those made wholly

or in chief value of wool or of camel's hair, and (2) those made of the hair of the Angora goat, alpaca, and other like animals. The rates of duty were 18 per cent and 25 per cent, respectively, for the two classifications. During the period of 2,704 days, prior to the passage of the emergency act of May 27, 1921, the equivalent ad valorem duty for the two types of yarns was 19.36 per cent per annum. The emergency tariff act was in effect 482 days, from May 28, 1921, to September 21, 1922, inclusive, and under this law a duty of 45 cents a pound was imposed in addition to the previous ad valorem duties. During the 482 days the total yarns imported amounted to 4,733,297 pounds, valued at $5,275,811, and the equivalent ad valorem duty was 59.09 per cent. During the 3,186 days covering the entire period of the act of 1913, both before and after its modification by the emergency tariff act, the equivalent ad valorem duty for all yarns under this classification averaged 27.69 per cent.

The act of 1922 provides for yarns made wholly or in chief value of wool or of hair of the camel, goat, alpaca, or other like animals under specific and ad valorem rates based upon value as follows: (1) Valued at not more than 30 cents per pound, (2) valued at more than 30 cents and not more than $1 per pound, and (3) valued at more than $1 per pound. Although the equivalent ad valorem duty in 1923 was 67.34 per cent, importations for that year were the largest of any one year in history, amounting to 5,617,321 pounds, valued at $7,238,370. In 1924, however, there was a falling off to 3,120,690 pounds, valued at $4,416,431; the equivalent ad valorem duty was 65.21 per cent.

The figures given in the following table show imports for consumption in 1923 and 1924 of the yarns described herein; the bulk had a foreign value of more than $1 per pound, a small percentage had a foreign value of more than 30 cents and not more than $1 per pound, while practically none was valued at 30 cents or less a pound.

TABLE 37.—*Imports for consumption of yarns under each value classification, 1923 and 1924*

Yarns valued at—	Quantity in pounds		Per cent of total	
	1923	1924	1923	1924
Not more than 30 cents per pound	208	21	0.004	0.001
More than 30 cents but not more than $1 per pound	1,075,862	216,677	19.152	6.943
More than $1 per pound	4,541,251	2,903,992	80.844	93.056
Total	5,617,321	3,120,690	100.00	100.00

The rates of duty imposed by the tariff act of 1922 are higher than those of the acts of 1894 and 1913, but lower than those of the acts of 1890, 1897, and 1909.

During the period that each of the last six tariff acts remained in effect the average yearly imports for consumption fluctuated to a considerable extent. For instance, under the act of 1890 the average per year was 862,815 pounds; under the act of 1894, 2,559,350 pounds; under the act of 1897, 239,002 pounds; under the act of 1909, 197,018 pounds; under the act of 1913, 2,413,012 pounds. In 1923, the first full year under the act of 1922, imports were 5,617,321 pounds, and in 1924, 3,120,690 pounds.

Rates of duty.—The rates of duty, classified according to the different tariff acts, 1883–1922, are given in the accompanying tabulation.

TABLE 38.—*Yarns of wool or hair—Rates of duty*

Act of—	Par.	Tariff classification or description	Rate of duty
1883	363	* * * woolen and worsted yarns, and all manufactures of every description, composed wholly or in part of worsted, the hair of the alpaca, goat, or other animals (except such as are composed in part of wool), not specially enumerated or provided for in this act, valued at—	
		Not exceeding 30 cents per pound	10 cents per pound and 35 per centum ad valorem.
		Above 30 cents per pound and not exceeding 40 cents per pound.	12 cents per pound and 35 per centum ad valorem.
		Above 40 cents per pound and not exceeding 60 cents per pound.	18 cents per pound and 35 per centum ad valorem.
		Above 60 cents per pound and not exceeding 80 cents per pound.	24 cents per pound and 35 per centum ad valorem.
		Above 80 cents per pound	35 cents per pound and 40 per centum ad valorem.
1890	391	On woolen and worsted yarns made wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals, valued at—	
		Not more than 30 cents per pound	27½ cents per pound and 35 per centum ad valorem.
		More than 30 cents and not more than 40 cents per pound	33 cents per pound and 35 per centum ad valorem.
		More than 40 cents per pound	38½ cents per pound and 40 per centum ad valorem.
1894	280	On woolen and worsted yarns made wholly or in part of wool, worsted, the hair of the camel, goat, alpaca, or other animals, valued at—	
		Not more than 40 cents per pound	30 per centum ad valorem.
		More than 40 cents per pound	40 per centum ad valorem.
1897	365	On yarns made wholly or in part of wool [1] valued at—	
		Not more than 30 cents per pound	27½ cents per pound and 40 per centum ad valorem.
		More than 30 cents per pound	38½ cents per pound and 40 per centum ad valorem.
1909	377	On yarns made wholly or in part of wool [2] valued at—	
		Not more than 30 cents per pound	27½ cents per pound and 35 per centum ad valorem.
		More than 30 cents per pound	38½ cents per pound and 40 per centum ad valorem.
1913	287	Yarns made wholly or in chief value of wool [3]	18 per centum ad valorem.
	307	Yarns made of the hair of the Angora goat, alpaca, and other like animals.	25 per centum ad valorem.
1921 [4]	19	* * * manufactures of which wool or hair * * * is the component materials of chief value.	45 cents per pound in addition to the rates of duty imposed thereon by existing law.
1922	1107	Yarns made wholly or in chief value of wool [5] valued at—	
		Not more than 30 cents per pound	24 cents per pound and 30 per centum ad valorem.
		More than 30 cents and not more than $1 per pound	36 cents per pound and 35 per centum ad valorem.
		More than $1 per pound	36 cents per pound and 40 per centum ad valorem.

[1] Including hair of the sheep, camel, goat, alpaca, or other like animals, by virtue of paragraph 383.
[2] Including hair of the sheep, camel, goat, alpaca, or other like animals by virtue of paragraph 395.
[3] Including wool or hair of sheep, camel, or other like animals by virtue of paragraph 304.
[4] Emergency tariff act, May 27.
[5] Hair of the camel, goat, alpaca or other like animals.

COURT AND TREASURY DECISIONS

Yarn made of hair of the common goat was held dutiable as wool yarn by similitude under paragraph 377 of the tariff act of 1909, rather than as a nonenumerated manufactured article. (Abstract 25370, T. D. 31524, of 1911.) Merchandise described as wool and silk yarn, which was imported with incomplete embroidered cushion covers, was classified by the collector as embroidered articles under paragraph 358 of the act of 1913. The Board of General Appraisers held that the yarn and covers should not be treated as an entirety and sustained the claim in the protest that the wool yarn was dutiable under paragraph 287 and the silk yarn under paragraph 313 of the act of 1913. (G. A. 8105, T. D. 37402, of 1917.)

Roving yarn, slightly twisted, which was capable of further twisting or elongation and which had not been on the spinning frame, was held dutiable as roving or roping under paragraph 286, rather than as yarn under paragraph 287. (G. A. 7958, T. D. 36675, of 1916.) Under instructions from the Treasury Department, however, merchandise of this character was assessed as wool yarn under paragraph 287 with a view to the presentation of a new case. (T. D. 37148, of 1917.)

Angora rabbit-hair yarn, commercially known as Angora wool yarn, was held not dutiable as a manufacture of fur under paragraph 348 of the act of 1913. The court laid down the following principles: Such yarn is more specifically described in paragraph 307 as "yarns made of the hair of the Angora goat, alpaca, and other like animals" than by the definition of wool in paragraph 304, "wool or hair of the sheep, camel, or other like animals," and is dutiable accordingly. The making of yarns is not, properly speaking, a fur use and the yarn made of hair can not be a manufacture of fur. Angora rabbit hair resembles that of the Angora goat or alpaca more nearly than it does that of the sheep or camel. Hair which is so short that it is commercially unfit to be spun into yarn or for the making of textiles and is chiefly employed in the making of furs or fur garments or for other fur uses, is a kind of hair which is known as "fur," though it be taken from the back of a sheep. Hair which possesses all of the characteristics of fur, but is so long and of such quality that it can be spun into yarn and converted into cloth and is chiefly used for that purpose, should be classified as a wool or as hair other than fur. "Other like animals" used in paragraphs 304 and 307 with reference to wool and hair regarded similarity in the hair and not in the animals themselves. (Bloomingdale Bros. *v.* United States, 8 Ct. Cust. Appls., 104, of 1917.)

Yarn made from the hair of the Angora rabbit was held not covered by paragraph 19 of the emergency tariff act of 1921 but remained dutiable under paragraph 307 of the act of 1913. (G. A. 8694, T. D 39833 of 1923.)

APPENDIX

Hours and Wages

The number of hours of work for operators in the more important occupations preliminary to weaving, in the domestic wool-manufacturing industry, has been substantially reduced in the last few years. In 1920 mills employing the bulk of the labor in these occupations adopted the 48-hour schedule in use to-day. Table 39 presents a tabulation of figures furnished by the Bureau of Labor Statistics, which shows the percentage of employees and their full-time hours per week in various kinds of work for specified years. The figures given were obtained from 47 representative establishments in 1913 located in 9 States, and 67 such establishments in 1922 located in 9 States, in which the manufacture of woolen and worsted goods is an important industry. These figures show that in 1913, 55.1 per cent of the full-time male employees in such mills worked 54 hours per week and 44.9 per cent worked more than 54 hours; whereas in 1922, 88.1 per cent worked 48 or fewer hours per week and 11.9 per cent more than 48 hours. In 1913 approximately 44 per cent of the full-time female employees worked 54 hours per week, and 56 per cent worked more than 54 hours; in 1922, 84.8 per cent worked 48 or fewer hours per week and 15.2 per cent between 48 and 54 hours.

NOTE.—Where 1913 figures are not given they were not recorded in the statistics.

Table 40 is inserted to show particularly the relation of the wages, as published by the Bureau of Labor Statistics, paid in various years to employees in wool manufacture in the chief operations preliminary to weaving. It includes, in addition to the earnings per hour and per week, other data reported to that bureau by wool-manufacturing establishments—namely, the number of such establishments; the number of employees, classified according to occupation and sex; and the average full-time hours per week. The mills covered include many of the most important and representative establishments in the States in which woolen and worsted manufacturing is a prominent industry. Considering only occupations for which wages were recorded in both years, these figures show for male employees an average wage per hour of $0.187 in 1913 and of $0.580 in 1924, an increase of 210 per cent in 1924 over 1913. For female employees the average wage was $0.131 per hour in 1913 as compared with $0.418 in 1924, an increase of 219 per cent in 1924 over 1913.

Considering all occupations for which wages were recorded in 1924, the average wages per hour in that year were $0.521 for males and $0.42 for females. Taking the last two figures as a basis for calculation, male employees received $25.01 and female employees $20.16 for a 48-hour week.

TABLE 40.—*Number of establishments, employees, and wages by specified occupations, in woolen and worsted industries, 1913–1924*[1]

Wages in the United States and foreign countries.—It was not possible to obtain the wages paid in the important foreign countries for each of the occupations shown in Table 40, but Table 41 shows the great difference in wages paid to employees in this country and abroad for some of the occupations in wool manufacturing. The figures were obtained from several reliable sources, and the comparisons given are considered approximately correct for July, 1924, based on a 48-hour week.

TABLE 41.—*Wage comparisons in the United States and in the principal foreign woolen and worsted manufacturing countries,* [1] *July, 1924*

[Wages per week]

Occupation and sex	United States	England	France	Germany [2]
MALE				
Wool sorters	$37.24	$14.82	$8.00	----------

[1] The dates given are those on which changes were made in the uniform lists published by Wool Combers, Ltd. The English charges were converted into United States currency at the prevailing rates of exchange.

Combing charges in the United States have always been considerably higher than those in England, i. e., in 1914, 46 per cent; 1919, 55 per cent; 1921, 70 per cent; 1923, 63 per cent; 1924, 52 per cent, and in 1925, 67 per cent.

ACTIVITY OF WOOLEN AND WORSTED SPINDLES

Table 43 gives a detailed tabulation of the active woolen and worsted spindles by months, as compiled by the Census Bureau from 1919 to May, 1925, inclusive. A summary of the yearly averages is shown in Table 22 (p. 36).

REGAIN

Wool has a greater affinity for moisture than any other fiber. Even under ordinary atmospheric conditions, wool tops and wool yarns will readily increase or decrease in weight, according to the temperature and the relative humidity of the air by which they are surrounded. The increase in weight, when a bone-dry fiber is placed in an atmosphere containing moisture, is known as "regain," and the amount of moisture so absorbed is an important factor in buying and selling tops and yarns by weight.

In England and France there are official conditioning establishments to which wool tops, wool yarns, etc., can be sent to determine the moisture content. Several years ago the United States Conditioning & Testing Co. was established in New York City for the purpose of making accurate and impartial tests of raw and manufactured textile materials and, although it was originally established for the testing of silk, to-day its laboratories are equipped to do all kinds of general textile testing, and such tests will be made for anyone upon application. There are other institutions which have facilities for making any practical test of wool and wool products, and some are equipped to make the most intricate determinations of these commodities. Such establishments are the United States

Bureau of Standards, the Massachusetts Institute of Technology, the Lowell Textile School, etc.

The results of conditioning will show the marketable weight of the material; and in the foreign countries cited above, wool tops and yarns are usually bought and sold on the basis of standard regains.

The standard regains adopted by the Bradford Conditioning House, England, for wool tops and wool yarns are as follows:

	Per cent
Wool tops, oil-combed	19
Wool tops, dry-combed	18¼
Wool yarns	18¼

Many years ago the general impression of top makers and traders in tops was that, owing to our drier climate, a difference of from 2 to 3 per cent in regain could be expected between this country and England or continental Europe. After many years of scientific research it was found that for Lawrence, Mass. and vicinity the average natural condition of tops would be about 15 per cent regain. Most of the trade in tops in this country has accepted a 15 per cent regain as the standard. Practically all of the yarn trade, however, is carried on without consideration of a standard regain as a basis for the correct commercial weight.

A small percentage variation in the weight of a transaction involving 10,000 or 50,000 pounds may mean a considerable loss to the buyer or seller if he fails to take into account the moisture content. This is especially true when materials such as these are sold for 75 cents to more than $1.75 per pound. The establishment of regain standards for these commodities in the United States is therefore of considerable importance.

While it is desirable that the allowance for moisture should be as near the actual regain as possible, a variation makes no real difference as long as both parties to a transaction understand the basis on which they are dealing. The commercial importance of regain standards has been intermittently discussed during the last 35 years; and, as a matter of convenience, standards will undoubtedly be agreed upon in the future.

The value of conditioning is well illustrated by the report of the Bradford Conditioning House, Bradford, England, wherein it is stated that 58,749,870 pounds of tops and 3,498,097 pounds of worsted yarns passed through for testing purposes during 1924.

PARAGRAPH 281 OF THE TARIFF ACT OF 1913

WITH RELATED ARTICLES IN OTHER PARAGRAPHS

BAGS OF JUTE AND COTTON

Paragraph 281:

Bags or sacks made from plain-woven fabrics, of single jute yarns, not processed.

Paragraph 284:

Basket paragraph, which includes jute bags or sacks made from: (1) plain woven fabrics, of single jute yarns, processed; (2) fabrics other than plain woven, or of other than single jute yarns, whether processed or not; (3) bags or sacks made from vegetable fibre other than jute or cotton.

Paragraph 266:

Basket paragraph which includes bags of cotton.

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the United States Tariff Commission and transmitted to the Committee on Ways and Means. The series covers all of the articles and commodities provided for in the tariff act of October 3, 1913, and others not specifically provided for. It is arranged in the numerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in one pamphlet. In doing this, industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act, reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article was provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index" the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of John J. Cameron of the textile division of the commission's staff, and of others.

BAGS OF JUTE AND COTTON.

TARIFF ACT OF OCTOBER 3, 1913.

[Text of Schedules I and J, relating to bags of jute and cotton.]

PAR. 281. Bags or sacks made from plain woven fabrics, of single jute yarns, not dyed, colored, stained, painted, printed, or bleached, 10 per centum ad valorem.

PAR. 284. All woven articles, finished or unfinished, and all manufactures of flax, hemp, ramie, or other vegetable fiber, or of which these substances, or any of them, is the component material of chief value, not specially provided for in this section, 35 per centum ad valorem.

PAR. 266. All articles made from cotton cloth, whether finished or unfinished, and all manufactures of cotton or of which cotton is the component material of chief value, not specially provided for in this section, 30 per centum ad valorem.

SUMMARY.

The American production of and trade in jute and cotton bags may be considered in the following order: (1) New jute bags, (2) new cotton bags, (3) secondhand bags of jute or cotton.

1. NEW JUTE BAGS.

Imports of jute bags, under the classification of the tariff act of 1913, fell into two classes: (1) Bags or sacks, new or secondhand, made from burlap—a plain woven cloth of single jute yarn—which were not printed or otherwise processed; (2) all other jute bags, whether new or old, such as those made from burlap that has been processed, or those manufactured from a cloth not plain woven—for example, that woven with a twill.

Burlap bags are used for shipping those commodities which require a cloth of stronger texture than can be produced from cotton except at a price much higher than that commonly asked for burlap. A great variety of sizes and types of burlap bags, printed with brands or trade-marks, are manufactured in this country for sacking grain, bran, feed, fertilizer, flour, sugar, vegetables, and other bulky commodities.

New bags made from jute cloth other than plain woven are not manufactured in this country and are not used in the United States, except in the island of Porto Rico. The bulk of such bags enters this country as containers for imported products.

According to a special census taken by the Tariff Commission, the number of new burlap bags produced by American bag factories was 388,526,154 in the calendar year 1914 and 457,306,416 in the calendar year 1919.

The domestic production of jute bags other than burlap is negligible, because domestic manufacturers hold that, with no differential

between the duty on the twilled cloth used in the manufacture of such bags and on the completed bag, it is not profitable to make such bags in competition with India.

With the exception of the grain bags, commonly known as centals, which are imported from India, foreign competition in new burlap bags is negligible. The importation and consumption of centals are confined to our western coast.

According to statistics of the Indian Government, exports from India to our western ports [1] of "gunny bags," including bags made from burlap and from sacking, remained practically the same in the years 1908–1916. Their number averaged yearly between 32,000,000 and 33,000,000.

Since 1916 India's exports of burlap bags to our Pacific ports have been:

	Number.
1917	17,559,200
1918	38,037,400
1919	34,595,000
1920	33,018,000
1921	59,080,400

During the 12 months ended March 31, 1921, India shipped to the eastern and western ports of the United States a total of 64,300,400 bags of burlap. In addition she exported annually to the Pacific coast an average of 2,064,490 bags made of sacking during the period 1917–1921. These were probably for transshipment.

The domestic production of centals averages about 15,000,000, or about one-third of the domestic consumption.

Normally exports of burlap bags from the United States are negligible, but in 1919, owing to conditions growing out of the war, they amounted to nearly 3,000,000 new bags and 4,000,000 secondhand bags.

The American producer of new burlap bags has, with the exception of the trade in centals, entire control of his home market. Imports of centals are equal to between 8 and 11 per cent of the total production of burlap bags.

In the manufacture of jute products India possesses two marked advantages—a local supply of raw material, jute, and a plentiful supply of cheap labor. These advantages enable the Indian manufacturer to land centals on the Pacific coast, notwithstanding the 10 per cent duty, at a lower price than they can be made locally.

India's competition is limited to centals, because these bags are unprinted, standardized, and used in large quantities. India's lack of printing facilities and the 1913 tariff of 35 per cent on printed bags, or bags manufactured from a cloth not plain woven, have rendered it unprofitable for India to compete in supplying a number of different sizes of burlap bags or to introduce bags made of sacking into American markets.

2. New Cotton Bags.

Cotton seamed bags are used for putting up (1) those products which are pulverized or fine, and so require a cloth of close-woven mesh; (2) those products which are commonly retailed in small

[1] Hawaii not included.

quantities in cloth bags; (3) those commodities which demand a bag with a lint that will not affect the contents of the bag.

The leading products shipped in ordinary cotton bags are flour, sugar, cement, meal, feed, and salt.

Seamless bags are used for sacking seeds, peas, beans, and similar produce.

Cotton seamed bags are sewn by machines and are the product of companies that specialize in the manufacture of bags, whereas cotton seamless bags are usually woven by mills which produce them as a subsidiary part of their business. The number of each type produced in continental United States in 1914 and 1919 were:

	1914	1919
Cotton seamed	536,347,285	501,767,657
Cotton seamless	6,964,317	4,683,914

The decline in the production of cotton seamed bags in 1919 may be attributed to the lack of labor. The lower price of the burlap bag, which led to a partial substitution of such bags in cases where burlap and cotton bags are interchangeable was a second factor in their decline.

Imports of cotton bags occur at rare intervals and only in negligible quantities. The largest shipment in recent years was in 1917, when according to Japanese statistics, this country received from Japan 23,600 flour bags, valued at $727.68.

The American manufacturer of cotton bags is free from foreign competition in his home markets. This is likely to continue while the United States holds its present rank as a grower of cotton and as an exporter of cotton cloth.

3. Secondhand Bags of Jute and Cotton.

Except in times of shortage, the bulk of secondhand burlap bags is used to sack vegetables, produce, and feed. As there is objection to the use of secondhand bags as containers for foodstuffs, the number of secondhand cotton bags sold is decidedly less than that of secondhand burlap bags. When not used as containers, secondhand jute bags are cut up either to make smaller or converted bags for holding fittings and machine parts, or to serve as a covering, particularly for the cotton crop.

An estimate made by an association of prominent dealers sets the number of secondhand burlap bags of domestic origin used yearly at about 500,000,000. To this must be added the jute bags sent to this country as containers for products exported to the United States. In contrast, the number of cotton bags used a second time is equal to only 2 or 3 per cent of the annual production of such bags.

Owing to the high price of new bags, the trade in secondhand bags assumed greater importance after 1914. For instance, the secondhand burlap bags sold by 24 prominent dealers in 1914 numbered 34,219,960 and in 1919, 66,714,664. The secondhand cotton bags sold in 1914 by 11 of the above companies numbered 1,887,184; and by 15 in the year 1919, 3,225,459.

23253—23—J-9——2

Imports of secondhand bags come from the United Kingdom. The largest number exported from this source to the United States was in 1909, when they totaled 6,243,612 bags.

That imports of secondhand jute bags have been so small was due to the 1913 tariff, under which secondhand bags other than plain woven and unprinted were dutiable at 35 per cent.

GENERAL INFORMATION.

Description and Uses.

JUTE BAGS.

Imports of jute bags, under the 1913 tariff act, fell into two classes:

1. Burlap bags which have not been dyed, painted, printed, or bleached, dutiable at 10 per cent under paragraph 281.

2. All other bags of jute which have been processed, e. g. printed, or dyed, or which have been manufactured from a cloth that is not plain woven, such as sacking, dutiable at 35 per cent under paragraph 284. This is a general paragraph relating to all woven articles manufactured from vegetable fibers other than cotton.

The term "burlap," known in foreign markets as "hessian," refers to a plain woven cloth of single yarns produced from long jute; and the word "sacking" to a twilled cloth made from the heavier and coarser grades of jute fiber.

Gunny bags are bags made from sacking. The word "gunny," however, in its broader and popular sense has come to be applied to all cloths and bags made from jute. For instance, statistics of the Indian Government now divide exports of jute cloth and bags into "sacking gunny cloth," "hessian gunny cloth," "sacking gunny bags," and "hessian gunny bags."

Jute bags are the most widely used means of sacking commodities. In the United States the output of jute bags is limited wholly to burlap. Practically all the burlap bags consumed in this country consist of seamed bags. The number of seamless burlap bags woven on looms is less than one-fourth of 1 per cent of the domestic production of seamed burlap bags.

Jute bags are used in this country for the shipment of a great variety of products—for example, grains, fertilizers, sugar, flour, feed, produce, vegetables, binder twine, and nursery stock. According to their uses, they vary in size, weight, and grade of cloth.

The chief uses are for shipping grain, bran, and feed. The number employed in putting up fertilizer probably constitute the next leading use. Fertilizer is shipped in 100 and 200 pound bags. For putting up flour and sugar, as well as salt, both cotton and burlap bags are used. Millions of burlap bags are used annually for exporting flour, which is sacked in quantities of 140 pounds. Other important uses are for shipping produce, feed, and vegetables.

Leading types of imported bags.—Bags produced here are printed with various brands as ordered, whereas imported bags are unprinted. The tariff act of 1913 levied an additional duty of 25 per cent ad valorem on printed bags.

Imported jute bags are confined to (1) grain bags used for sacking 100 pounds of wheat, commonly known as centals, which are imported from Calcutta to the Pacific coast; and to (2) sugar bags for

shipping raw sugar from Cuba, Porto Rico, and Hawaii to refineries in the United States. Centals are used in the shipment of wheat. They measure, with hemmed top, 22 inches in width and 36 inches in length and weigh 12 ounces. Imported centals are manufactured from 10-ounce burlap, 36 inches in width, cut 46 inches, or of a width ranging from 40 to 45 inches, cut about 39 inches long, the cloth counting 11 porter and 12 shot,[1] whereas the domestic bag is made chiefly of 37-inch 10-ounce cloth cut about 46½ or 47 inches long, and when sewed is of the same size and weight as the bag manufactured in Calcutta.

Cuban and Porto Rican sugar bags, which are seldom manufactured in this country, are large and heavy. They are made to hold 320 pounds of sugar. They are not manufactured from burlap, but from twilled jute cloth, and have been subject to a duty of 35 per cent ad valorem. Weight for weight they are cheaper than the lighter domestic burlap bag. The Cuban bag measures 28 inches in width and 48 inches in length and weighs 2½ pounds. It is made with a blue stripe running longitudinally, and is often called the "blue-stripe" bag. The sugar bag used in Porto Rico is 26½ by 44 inches and weighs between 2¼ and 2½ pounds. The sugar bag used in Hawaii is manufactured from a better burlap fabric than ordinary hessian cloth. The Hawaiian bag measures 22 by 36 inches in size, weighs 16 ounces, and has a capacity of 150 pounds.

COTTON BAGS.

The cotton bag is extensively employed to ship commodities which require a close-woven fabric. The chief use is to ship flour. Estimates of the quantity so used vary from 62½ to 90 per cent of domestic consumption. For the distribution of flour in packages up to 98 pounds, cotton bags are considered superior to burlap. For putting up sugar, in quantities under 100 pounds, cotton bags are extensively used. Many are also used in shipping cement.

Peas, beans, seed, and similar commodities are for the most part put up in cotton seamless bags, which are stronger than the ordinary cotton bag. Cotton seamless bags, unlike the cotton bag sewn by machine, can be used many times and are convenient for handling produce carried in semibulk in retail stores. The greater number of the cotton seamless bags produced in this country measure 44 inches in length and 20 inches across, and are known as 2-bushel bags. The standard weight is 16 ounces.

Burlap bags are superior to cotton bags for shipping rough commodities requiring strength. Burlap is cheaper, does not rip when snagged, and does not stain easily. Cotton bags are, on the other hand, superior for finely-ground products. They give off less lint than burlap and they take the imprint of trade-marks more readily. Under normal conditions there is little competition between the two. Only when the price of one is much higher than that of the other is substitution likely to occur.

[1] In Scotland the reed used in weaving is listed according to the number of "porters" or reed sections of 20 splits, 2 ends to a split, in the Scottish ell of 37 inches. An "11-porter 12-shot hessian" has about 13 warp ends and 12 picks per square inch of finished cloth.

[illegible]

[illegible] production was:

	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]

[illegible]

[illegible] producing [illegible] bags are found in the [illegible]. Their number in 1914 was [illegible] [illegible] wage earners. In 1919 they numbered [illegible].

PRODUCTION OF BURLAP BAGS.

In recent years there have been a number of factors tending to stimulate the domestic production of burlap bags. The entrance of the United States into the war resulted in a demand for bags for use as entrenchments and led to a marked increase in the use of bags as a substitute for wooden cases to reduce the bulk of shipments overseas. Owing to the relatively higher price of cotton bags in recent years an attempt was made to substitute burlap bags wherever possible. On the Pacific coast bags made of burlap were being extensively used in the summer of 1920 as carriers of cement. On this subject a western manufacturer reports that, when prices are normal, approximately [illegible] per cent of all the cotton bags produced on the Pacific coast are used for sacking cement. At the time of his writing, August, 1920, jute bags, however, were being used for containers for cement because their price was about half that of the cotton bag ordinarily used.

PRODUCTION AND CONSUMPTION OF CENTALS, 1914–1919.

The following table, showing the domestic consumption of centals, indicates the extent to which the United States relies on imports to supply its need of this particular type of bag:

Calendar year.	Total consumption.	Number manufactured in United States.	Number imported.
1914	56,12[illegible],200	11,240,000	44,883,200
1915	[illegible]	14,5[illegible]	31,011,200
1916	3[illegible],79[illegible]	16,15[illegible],000	17,539,200
1917	52,607,400	14,570,000	38,037,400
1918	49,712,000	15,117,000	34,595,000
1919	47,669,000	14,501,000	33,168,000

The totals relating to bags imported include India's shipments of: (1) Gunny bags to our western ports in the fiscal years ended March 31, 1915 and 1916; (2) hessian bags in 1917–1919; and (3) her combined exports of burlap to our eastern and western ports in 1920.

Owing to the extensive use of secondhand bags, the number of burlap bags in use in this country is in excess of the production of new bags. The National Burlap Bag Dealers' Association, which is an association of leading domestic dealers in secondhand bags, estimates that the number of secondhand burlap bags of domestic manufacture used in recent years has been in excess of 500,000,000 annually. That the number of secondhand burlap bags used in the years 1914–1920 was about equal to the production of new burlap bags is substantiated by a census of war commodities made in 1918 by the Department of Commerce. According to that census, the number of bags on hand as of June 1, 1918, reported by 3,473 establishments totaled 127,988,975 new bags and 91,100,607 secondhand bags. Of the new bags about 16,000,000 consisted of Cuban and Porto Rican sugar bags.[1]

The domestic production of cotton seamless bags has been falling off for a number of years. The chief reason for this decline has been the comparatively higher price of the seamless bag.

MATERIALS.

Burlap.—Burlap, or hessian as it is termed abroad, is a plain woven cloth manufactured from single jute yarns. Jute is grown in India, and with the exception of cotton is produced in greater quantities than any other fiber. Practically all the burlap consumed in the United States is imported from India and the United Kingdom.

In 1917 the consumption of 3,473 establishments in the United States was 627,691,204 linear yards. For 1918 their estimated consumption was 642,101,351 yards. In the 12 months ended June 30, 1921, imports into the United States were 474,000,000 pounds, equal to about 789,000,000 square yards. More than 99 per cent comes from British India and the United Kingdom.

Imports since 1904 have been as follows:

Quantitiy and value of imports of burlap, 1905–1921.

Period.	Total.		British India.		United Kingdom.	
	Average yearly quantity.	Average yearly value.	Average yearly quantity.	Average yearly value.	Average yearly quantity.	Average yearly value.
	Pounds.		*Pounds.*		*Pounds.*	
1905–1909 [1]	317,136,742	$21,379,161	257,022,688	$16,514,292	58,672,691	$4,714,228
1910–1914	421,383,181	29,420,977	358,704,219	24,083,977	59,867,928	5,049,257
1915–1919	415,483,840	48,331,193	373,514,527	41,974,961	38,020,795	5,683,446
1920	541,113,614	88,020,057	482,932,925	73,730,640	53,402,830	13,344,105
1921	474,168,221	41,279,072	444,669,569	36,561,420	26,064,594	4,259,821

[1] The quantities of burlap by countries were first given in 1905.

More than 80 per cent of the burlap imported, not bleached, dyed, or colored, is used in the manufacture of bags. Assuming that on the

[1] The results of this census are tabulated on p. 31.

average 1,000 burlap bags weigh 800 pounds,[2] 310,820,923 pounds were consumed in American bag factories in 1914 and 365,845,132 pounds in 1919, which represent 80 and 83 per cent, respectively, of the imports of burlap in those years.

The domestic production of burlap is small. There are two State prisons on the Pacific coast which import raw jute, manufacture burlap, and make bags, and one large concern in the East which makes the burlap used in packing its own product. During the years 1917 and 1918 there was a slight increase in domestic production, which was due to the installation of 285 looms by the Eastern firm mentioned above and to the production of a small part of exceptionally wide burlap by manufacturers of linoleum for their own use. In 1920 no American manufacturer of burlap bags was weaving burlap. India has a monopoly of the raw material, jute, and an abundance of cheap labor; the lack of these advantages is an obstacle to its production in the United States.

Sacking.—Sacking is a heavy, closely woven jute fabric, usually a twilled cloth in which the number of warp threads per square inch exceeds the number of weft threads.

Official statistics of India show that her exports of gunny sacking to the United States amounted to about 5,000,000 yards in,1917, to less than 1,000,000 in 1919, and to 4,564,300 yards in 1921, fiscal years. The bulk of these imports of sacking was probably for transshipment, or for reexport, or for manufacture into bags to be exported with the benefit of drawback. The domestic consumption is small.

Cotton cloth.—The principal cotton cloths used for making bags are osnaburgs, sheetings, and print cloths. These are coarse and medium grade cloths, woven from ordinary upland cotton. Some of the osnaburgs for bag making are made of low-grade cotton, mixed with waste. It is estimated that more than 75 per cent of the cotton cloth thus used is woven by mills that are not engaged in bag making, although several manufacturers of bags weave all or a part of their cotton cloth.

METHODS OF PRODUCTION.

Seamed bags.—Bags other than seamless are made by cutting up the cloth into definite lengths according to the size of the bag required, and then sewing the bottom and the side, or the sides only, on one of the various types of sack-sewing machines. The cloth is cut into the proper lengths either by hand or machine. The lengths are then separately doubled up, and the sides are sewn by special sewing machines and the ends hemmed. The name of the user or a trade-mark and other details are usually printed on the bags in one or more colors.

Seamless bags.—Seamless cotton bags are woven on a cam loom specially built for the purpose. The loom weaves a double or tubular cloth and at the bottom of the bag weaves solid. This makes the bottom and the sides of the bag seamless, and less liable than the ordinary seamed bags to break out either at the sides or at the bottom. Seamless bags are commonly made with either three or four leaf twill.

[2] Hearings before the Committee on Ways and Means, 1913, p. 4048.

All of the principal machinery used for making bags is manufactured in this country. The cutting machinery, sewing machines, printing presses, and baling presses are of domestic make. In the bleaching or other finishing processes, machinery of English make is occasionally to be found.

ORGANIZATION.

There are few domestic companies that specialize in the manufacture of new bags that do not make both burlap and cotton bags.

According to census reports, the industry has shown a steady growth since 1904. The number of establishments has been: 1904, 79; 1909, 109; 1914, 138; 1919, 216.

Secondhand bags.—Trade in secondhand bags is scattered among thousands of dealers. The bags are gathered up by rag and junk men all over the country, and are sorted out by them and sold to dealers operating in both large and small cities.

As showing the great variety of secondhand bags handled by the average firm, one company in New York City which sold 6,284,000, secondhand burlap bags in 1919, listed over 22 different types of bags, which it had handled during the course of the year, in quantities ranging from 2,000,000 for jute flour bags to 32,000 for cement bags.

Seamless bags.—In the years 1914 and 1919, according to the data at hand, there were seven cotton manufacturing companies that wove cotton bags as one of their products. Seamless burlap bags are comparatively rare in the United States. There is only one concern weaving such bags in this country; it manufactures them for the chemical industry.

GEOGRAPHICAL LOCATION.

In 1919 more than one-half of the 216 factories were located in six States, as follows: New York, 56; New Jersey, 14; Pennsylvania, 14; Maryland, 12; Virginia, 13; and Missouri, 10. The value of the product of the factories in these six States was as follows in 1919: Missouri, $38,020,623; New York, $26,821,939; New Jersey, $14,696,734; Pennsylvania, $6,979,582; Virginia, $4,840,831; and Maryland, $3,132,886. The value of the product of 5 factories in Louisiana was $18,310,111; of 6 factories in California, $13,414,851; and of 7 factories in Tennessee, $12,318,292. The greater number of the seamless cotton bags are the product of mills located in New England.

DOMESTIC EXPORTS.

Previous to 1914 the export of bags was relatively unimportant, but the World War resulted in a decided impetus, which extended through the fiscal year 1920, when exports were about 50 per cent greater in value than imports. The value of exports was 80 per cent less in the calendar year 1921 than in the calendar year 1920. Despite this decline, however, it was still about 50 per cent greater than the average during the five fiscal years 1910–1914. In the period 1915–1919 exports averaged $2,485,053. This was more than four times the average value during the previous decade.

The character of exports changed somewhat during the war period. Since 1910 exports have been distributed as follows:

Proportion of total exports of bags of vegetable fiber destined for specified countries, 1910–1921.

Exported to—	Fiscal years.			Calendar years.	
	1910–1914 (average).	1915–1919 (average).	1920	1920	1921
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
United Kingdom	25.7	5.9	0.9	1.3	0.4
Canada	13.6	10.6	10.0	14.5	23.1
Cuba	8.7	18.6	7.9	10.3	10.7
Mexico	7.6	10.5	5.1	8.7	25.7
Dominican Republic	2.7	9.4	2.9	5.0	7.1
Guatemala	.7	3.1	1.1	.5	.7
Argentina	13.8	4.6	51.6	27.2	4.5

Belgium	1.4	.6	.1	.2	.6
Germany	1.7	.....	.9	1.6	1.7
All other countries	24.0	34.7	19.5	30.6	25.3
Total	100.0	100.0	100.0	100.0	100.0

During the period 1914–1919 there was a marked increase in the number of burlap bags and a decided falling off in the quantity of cotton bags shipped from the United States. Reports from the leading domestic manufacturers of bags, and from 24 firms that make the collecting and selling of secondhand bags either the main or an important part of their business, and from 4 exporting houses, show that their combined export shipments of jute bags in the calendar year 1914 amounted to 500 new and to 1,334,775 secondhand bags; and in 1919, 2,945,300 new and 4,607,811 secondhand bags. The general term "jute" is used rather than "burlap" in connection with exports of bags, because there are no data at hand showing whether any of these bags were manufactured from sacking and exported with the benefit of drawback, or were secondhand bags of like material, originally sent into this country as containers for foreign products. The total for cotton bags in the same years was 642,000 new and no secondhand bags in 1914, and 284,400 new and 22,000 secondhand bags in 1919. These figures do not represent the total quantities of bags exported in these years, as they do not include shipments of new bags made by several manufacturers who considered them negligible and so did not record them.

Previous to 1914 the United Kingdom, Mexico, and Argentina received from one-half to two-thirds of the total value of all bags exported from the United States. Germany and Belgium, after the United Kingdom, were the best markets in Europe. Export trade to Argentina is subject to marked fluctuations. Shipments previous to 1914 consisted, for the most part, of cotton flour bags, a line in which the United States dominated the Argentine market. In Argentina American cotton bags had to compete with those imported from the United Kingdom; practically all of Argentina's imports of cotton bags were supplied by the United Kingdom and the United States. Before the war the United Kingdom found its best market for burlap bags in Argentina.

After 1915, Canada, Cuba, and Mexico became the principal markets for American bags of vegetable fiber; during the 5-year period 1915–1919 (fiscal years) they took 40 per cent of all bags exported, while in 1920 and 1921 (calendar years) they took 34 per cent and 59 per cent, respectively. The bulk of shipments to Cuba consists of second-hand Cuban sugar bags which are reexported after having been used as containers for raw sugar sent to this country.

The American exporter may find increased difficulty in marketing burlap bags in South America, because of the increased competition from the United Kingdom and India, and possibly because of the fact that South American countries may follow the example of Brazil, which has encouraged the importation of raw jute by the establishment of a prohibitive tariff on jute cloth and jute bags, and has consequently become practically self-sufficient in the matter of burlap containers for her principal products. The latest reports are that the Brazilian Government is considering the promotion of jute growing in Bahia and Sao Paulo, where the climate is said to be similar to that of India.

There is every likelihood that cotton bags, upon a decline in high prices, will again form the bulk of bag exports from this country. In spite of the tariff on jute bags by a number of South American countries (in a number of cases prohibitive), in the main the quantity of cotton bags is not affected to any extent by customs duties.

DRAWBACKS.

The American manufacturers of burlap bags have taken advantage of the drawback law which provides for a refund of 99 per cent of the duty on all imported burlap when manufactured into bags and exported.

The following table shows the extent to which the trade is affected by the drawback:

Fiber bags exported with benefit of drawback, 1903–1921.

Fiscal years.	Number.	Pounds of burlap contained therein.	Value of burlap.	Drawback paid on bags.
1903	[1] 31,876,121			$461,444.64
1904	28,678,271			399,233.01
1905	20,579,996			277,269.02
1906	20,445,902			281,482.11
1907	24,775,358			352,470.99
1908	27,087,986			459,891.69
1909	24,670,734			395,210.15
1910	16,133,357			249,275.65
1911	17,529,710	[2] 16,785,413	[2] $889,509.11	234,403.76
1912	20,070,241	19,334,971	1,041,709.71	271,312.07
1913	12,247,893	18,917,719	1,234,323.13	302,404.00
1914	17,024,857	15,476,528	1,310,216.13	297,367.03
1915	4,253,238	3,585,474	309,273.00	82,664.03
1916	655,044	275,499	21,917.00	20,649.70
1917	425,194	59,808	4,875.00	17,218.13
1918	729,609	348,374	29,999.00	17,366.23
1919	89,813	36,794	2,918.00	3,606.41
1920	81,199	54,853	4,238.00	2,367.49
1921 [3]	103,822			7,452.71

[1] Number of bags exported with benefit of drawback not recorded before 1903.
[2] The quantity and value of burlap contained in bags so exported are not available before 1911, nor since 1920.
[3] Calendar year.

In addition to the export of bags of domestic manufacture there has been some reexport of bags of foreign origin, and this trade has made a substantial increase since 1914.

FOREIGN PRODUCTION.

INDIA.

India is by far the largest manufacturer of jute products in the world. The causes contributing to this are a monopoly of the raw material and an abundance of cheap labor.

India is also the world's leading exporter of jute goods. Her exports represent about 60 per cent of her production. This production constitutes about 52½ per cent of the world's output of jute goods. The total value of manufactured jute shipped abroad in 1918 amounted to $170,823,883, constituting in that year 22 per cent of her combined exports of all commodities as against 9 per cent for the five-year period preceding the war. Her consumption of raw jute, in bales of 400 pounds each, advanced from 460,000 in 1874, or from less than one-fifth of all the raw jute grown, to approximately 5,000,000 in 1914, or to about one-half of the world's production. In the same time the consumption at Dundee, the chief manufacturing jute center after Calcutta, increased from 1,200,000 bales to 1,295,000 bales, declining from approximately two-fifths of the world's crop to one-eighth; while the Continent of Europe increased its consumption from 300,000 bales in 1874 to 2,610,000 bales in 1914, or from less than one-eighth of the world's production to more than one-fourth.

The Indian jute mills are usually of an up-to-date type. Many are driven by electricity generated from coal. Since the war the jute industry in India has become more and more independent of Great Britain in the matter of machinery.

In point of quantity India's average yearly exports of jute bags during the years 1907–1914 were equal to about 80 per cent of the American production. During the same period she shipped 15.25 per cent of her total exports of gunny bags to Australia, 13.71 per cent to the United States, 10.22 per cent to Chile, and 3.78 per cent to Egypt.

Exports during the first year of the war were about 397,000,000 bags. In the year 1915–16, largely because of the tremendous demand of the United Kingdom for burlap bags for military purposes, shipments of bags were over 794,000,000. This increase was maintained during the following two years. With the cessation of war Indian exports fell to the level established in the years preceding 1914. For the fiscal year ended March 31, 1919, foreign shipments totaled 583,095,999 bags. For 1920 they showed a further decline to 342,729,000. In 1921 shipments amounted to 533,908,109 bags.

Normally the bulk of India's exports consists of bags made from sacking.

The United States is India's best customer for burlap cloth and burlap bags. Exports of burlap cloth to the United States amount to about two-thirds of all the burlap cloth shipped yearly. In contrast, shipments to the United States of burlap bags amounted in 1920 to 33,168,000, or 38 per cent of all the hessian bags exported in that year; and to 64,300,400 or 47 per cent in 1921. Australia and the United Kingdom were the next best markets.

DUNDEE.

The city of Dundee, which, up to 1855, was the only center for jute goods produced by machinery, is to-day second to Calcutta as a manufacturer of jute products. Dundee really represents the jute industry of the United Kingdom, for the output of the few jute mills at Aberdeen and other points forms but an insignificant part of the total. It is estimated that Dundee exports 40 per cent of her output of jute goods, which is equivalent to about one-eighth of the world's production. The Dundee mills do not compare in size with those in India. As they are older they are usually inferior in construction and are not equipped with up-to-date machinery.

In point of number of looms and operatives, the jute industry of Dundee has remained practically stationary for the last 30 years. In December, 1919, Dundee was employing about 35,000 operatives, as against an average of 264,373 workers in India for the fiscal year 1920. Owing to the greater efficiency of the Dundee operatives these totals do not indicate the relative productivity of the two countries. Largely because of the rise of the Calcutta jute industry, Dundee has made very little progress since 1881 in the production of jute goods of the coarser varieties.

During the years 1900–1916 the United Kingdom's export trade in bags increased between 9,600,000 and 10,800,000 every five years. For the five years 1905–1909 the average yearly quantity was 39,637,128 bags, valued at $3,731,885, which represents an increase of 35.63 per cent in quantity and 44.16 per cent in value over the shipments for the preceding five years. The years 1910–1914 recorded a further expansion to an average yearly quantity of 50,619,396 bags, valued at $5,096,535. The first two years of the World War, with exports of 50,899,000 and 51,376,000 bags, respectively, showed a further advance in the number of bags exported. For the year 1917, however, the number declined to 37,670,000, and for 1918 it fell to the low figure of 10,731,000. This decline in exports was largely due to the effects of the war. During the year 1918 exports from Dundee, consisting mainly of flax and jute products, were completely under Government control and were generally curtailed, so far as the civilian trade was concerned.

Following the close of the war the United Kingdom's exports of bags have been as follows: 47,204,000 in 1919 and 37,378,092 in 1920.

In contrast to India, Dundee's foreign markets for bags are limited to those where she is favored by freight rates and where the demand is for small quantities of a bag of special type.

The United States, exclusive of Porto Rico, was the third best market of the United Kingdom during the years 1900–1914.

Average yearly exports of bags from the United Kingdom to the United States, by 5-year periods, 1900–1920.

Period.	Average yearly quantity.	Average yearly value.	Per cent of total quantity.	Per cent of total value.	Average price, in cents, per bag.
1900–1904	1,846,176	$114,683	6.92	4.43	6.29
1905–1909	2,956,932	117,034	7.46	3.14	3.96
1910–1914	3,547,704	151,100	7.01	2.96	4.26
1915–1919	676,680	75,012	1.71	.99	11.08
1920	163,152	77,893	.40	.60	47.74

Dundee has found it more and more difficult to compete in the cheaper grades of jute products, such as cloths and bags, manufactured in India and, to a lesser degree, on the Continent. Consequently, there has been a decided tendency in late years for Dundee to specialize in the higher grades of jute products, such as floor cloths, backings for lineoleums, and fine yarn. Thus the force of India's competition is being felt less and less in Dundee. Another factor tending to lessen competition is that the Calcutta mills are largely managed by Scotchmen and controlled by Scottish interests.

OTHER FOREIGN COUNTRIES.

As bags are easily made, there is a tendency for all countries to become independent of foreign sources for their requirements. The European markets for jute bags were formerly supplied almost entirely by Dundee. Within the last 40 years, however, such markets, through the erection of tariff walls, have been closed more and more to the foreign merchant. Thus, while the industry as a whole in the United Kingdom has made but little if any progress since 1880, the jute industries of Germany, Austria, France, Belgium, Brazil, and other countries have been making considerable headway.

The development of Japan's export trade during the war brought about an increase in her consumption and exportation of jute and cotton bags. Her exports of gunny bags were 864,000 in 1917; 4,066,000 in 1918; 10,967,000 in 1919; and 4,402,000 in 1920. Of the gunny bags exported, slightly more than 10 per cent in 1918, and less than 1 per cent in 1919 and 1920 were destined for the United States. Her exports of cotton bags were 11,151,000 in 1917; 13,754,000 in 1918; 8,044,000 in 1919; and 7,452,000 in 1920. Over 90 per cent in each year were exported to China. During the fiscal year 1917 the United States imported 1,052,332 pounds of burlap bags from Japan, while in the calendar year 1920 imports were 329,948 pounds.

Brazil has made such progress in the manufacture of jute products that she has become independent of foreign sources for the great number of bags necessary to move her crops. This is partly due to the high duty that Brazil levies on bags—so high that even the British, who are able to compete with other textiles of domestic manufacture, do not find it profitable to ship bags to Brazil.

The chief use of bags in Argentina is for sacking grain. It is estimated that over 100,000,000 are used annually for this purpose. Although the greater number of the bags consumed in Argentina are of domestic make, imports of jute and cotton bags are large and form a considerable percentage of the bags exported from the United Kingdom and the United States. In the first six months of 1919 there were imported into Argentina 36,800 metric tons of sacking for use in the manufacture of bags.

IMPORTS.

According to the reports of the Government of India, shipments of gunny bags from that country to Pacific ports of the United States (not including Hawaii) amounted to 44,883,200 for the fiscal year ended

March 31, 1915, and to 39,364,500 for the fiscal year 1919. Beginning with 1917, India has divided her shipments into "sacking bags" and "hessian gunny bags." Under the first of these headings the United States is credited with having received in 1919, through her Pacific ports, a total of 3,534,500 made from sacking material and under the second 34,595,000 made of burlap. India's shipments of bags to continental United States during the fiscal year ended March 31, 1920, totaled 33,168,000 hessian bags and 9,866,091 sacking bags, while in 1921 they totaled 64,300,400 hessian bags and 7,511,300 sacking bags.

In addition to secondhand bags of domestic origin millions of bags are sent to this country as containers of foreign products. The leading types of foreign bags are those containing sugar from Cuba and the Philippines, coffee from Brazil, linseed and corn from Argentina, cocoa beans from South America and the West Indies, copper ores from Chile, nitrates from Peru, argols and talcum powder from both Italy and France, and garnets from Spain. All these bags are of jute and for the most part of Calcutta manufacture.

BURLAP BAGS.

During the fiscal years 1900–1909 the British Empire supplied 98.71 per cent of the value of all jute bags brought into this country. During the four fiscal years 1911–1914 the percentage was even greater, but it fell off slightly after the war began. For the fiscal years 1915–1919 imports from the British Empire constituted 97.90 per cent of the quantity and 97.86 per cent of the value of the total imports. In the fiscal year 1920 the percentages were 94.81 of quantity and 95 of value, while in the calendar year 1921 they were 99 per cent of both quantity and value. Imports from the British Empire are mainly supplied by India.

Imports of burlap bags for consumption, which includes those consumed in Hawaii and Porto Rico, ranged during the fiscal years 1900–1914 between a minimum of 30,037,085 pounds in 1904 and a maximum of 62,875,362 pounds in 1914. The increase was most pronounced during the period 1905–1909, when the yearly average was 48,885,154 pounds. In 1910–1914 the yearly average showed a further rise to 52,138,628 pounds.

The first two years of the World War had no marked influence on imports of burlap bags, but during the fiscal years 1916–17 and 1917–18 imports declined to 35,055,490 pounds, and to 31,511,242 pounds, respectively. For the fiscal years 1918–19 and 1919–20 imported bags totaled 39,385,045 and 38,799,806 pounds, respectively, while for 1921 they rose to 70,632,965 pounds.

The decrease in quantities during the years 1915–1919, however, was not accompanied by a corresponding decline in value. The quantities used during the years 1915–1919 were 18.80 per cent less than in the preceding five years, whereas the average yearly value of such bags for the years 1915–1919 was $4,133,517, an increase of 21.96 per cent. In 1920 there was a further decrease in quantity accompanied by an increase in value, whereas in 1921 there was an increase over 1920 of 82.04 per cent in quantity, while the increase in value was 42.85 per cent.

The United States receives the bulk of her imports of jute bags from India. The value of those shipped from the United Kingdom formed a decreasing percentage of the total value of such imports from 1907 to 1919, when it may be said that they had disappeared. In 1920 and 1921 such imports from the United Kingdom amounted to 586,862 pounds and 5,300,610 pounds, respectively, in quantity, and $98,736 and $204,950, respectively, in value. The pre-war figures were considerably above those for 1921, however.

Secondhand bags.—Such bags as come to this country from the United Kingdom are for the most part secondhand or of special types.

Previous to the war, when shipping space could be easily obtained, the bulk of imports of secondhand bags consisted of those commonly known as Liverpool la Platas, so called because they were shipped to this country from Liverpool and were made up to a very large extent of bags which had been used when new as containers for products exported from Argentina. Since the war, bags originally filled with corn shipped from Argentina to the British Isles, and California centals, have constituted the larger part of imports of secondhand bags.

New bags.—India controls the import trade of the United States in new bags. She ships bags to both Pacific and Atlantic coasts with this distinction: That bags for Pacific ports consist of burlap bags for wheat, whereas those consigned to Atlantic ports are sacking bags that have Porto Rico, Cuba, and the West Indies as their final destination, where they serve as containers for raw sugar. Imports of jute bags through Pacific ports constitute between three-fifths and four-fifths of the value and quantity of all jute bags shipped into the United States. According to official reports of India, during the years 1908–1916 the number of bags received yearly on the western coast averaged between 32,000,000 and 33,000,000.

Since 1917 India has divided her exports of bags into two classes: "hessian gunny" and "sacking gunny."

Number of hessian gunny bags and sacking gunny bags shipped from India to the United States, 1917–1921.

Year ended March 31.	Hessian gunny bags.			Sacking gunny bags.		
	Pacific ports.	Atlantic ports.	Total.	Pacific ports.	Atlantic ports.	Total.
1917	17,559,200	4,991,200	22,550,400	1,276,200	8,749,100	10,025,300
1918	38,037,400	58,800	38,096,200	3,082,400	4,607,200	7,089,600
1919	34,595,000	1,735,000	36,330,000	3,534,500	6,583,200	10,117,700
1920	33,018,000	150,000	33,168,000	1,073,750	8,792,341	9,866,091
1921	59,080,400	5,220,000	64,300,400	1,355,600	6,155,700	7,511,300

COTTON BAGS.

Cotton bags are seldom imported; those of foreign origin come only in neglible quantities.

Costs of Production.

The cost of converting burlap or cotton cloth into bags forms a small part of the total cost of the bags. In recent years the prices of burlap and of cotton cloth have been far above normal and subject to sudden fluctuations.

Estimates given by representative companies regarding the ratio which the cost of manufacturing of bags in June–July, 1920, bears to the total costs of such bags, varied for cotton bags between 6 and 10 per cent and for burlap bags between 8.5 and 13 per cent.

The processes of making burlap and cotton bags are practically the same, and for the same size of bag would call for the same expenditure of labor. The higher percentage of manufacturing costs in the summer of 1920 for the burlap bag was due, first, to the greater cost of the cotton cloth, and, secondly, to the relatively lower selling price of the burlap bag.

Costs of manufacturing bags have advanced in recent years. In 1913 the president of one of the largest concerns, which has factories in different parts of the country, testified that in the previous year his company had produced 89,835,000 plain woven, unprinted burlap bags at a cost of $5.49 per thousand.[4] A firm located in the Middle West, which turned out a total of 28,000,000 bags in 1919, stated that the costs of manufacturing burlap bags per thousand in July, 1920, ranged from $10 to $20 and for cotton from $12 to $20.

In describing the increase in costs of production in recent years the president of a concern located in Pennsylvania wrote in June, 1920

> In the old days, before the war, we used to add $7.50 per thousand to the cost of the goods to cover all making costs and profit, but this figure was not nearly sufficient to let one out whole, and before the war we are rather of the opinion that this had about doubled. During the war, on account of the greatly increased wages, etc., it got up to $30 and is now down to about $25 or may be a little less. Different manufacturers, of course, figure in entirely different ways, depending largely upon whether they are busy or not, but we think you will find the above figures are not very far wrong.

[4] Hearings before Committee on Ways and Means, 1913, p. 3494.

In September, 1920, estimates furnished by representative firms specializing in the sale of secondhand bags concerning the percentage that the costs of repairing bags bears to their selling price ranged between 25 and 30 per cent. Of two other concerns, whose estimates differed from the majority of the trade, one stated that the cost of making the average secondhand bag serviceable was about 5 per cent of its selling price. This concern handles about 20,000,000 bags yearly, a substantial part of which consists of imported bags. The second firm set the cost at from 10 to 50 per cent of the selling price. An average of the costs submitted was 2.6 cents per bag. For heavy sugar bags, however, the cost was about 5 cents.

The cost of repairing secondhand bags has also increased in recent years. One of the largest handlers of secondhand bags, whose factory is located in New York, stated that its wage rates doubled between 1917 and 1920, and that in July, 1920, it was paying its factory employees for ordinary labor a minimum wage of $30 per week of 55 hours. Likewise, a firm which has its factory in a Southwestern State reported that many of the girls making new bags and patching up secondhand bags were averaging in October, 1920, between $4 and $5 per day in wages.

PRICES.

NEW BURLAP BAGS, 1914–1920.

As indicative of the trend of selling prices of burlap bags in the years 1914–1920, the selling prices of 100-pound feed bags, 140-pound flour bags, and the burlap bags containing 40 by 48 inches of 7½ or 8 ounce burlap may serve as examples. The prices of 100-pound and 140-pound bags were furnished by two companies, the first of which is located in Ohio and the second in Minnesota; the prices of the 40 by 48 were furnished by three concerns, with headquarters in California, Tennessee, and Wisconsin.

Prices of new burlap bags, 1914–1920.

Year.	Average 140-pound burlap bag.	Average 40 by 48 inch burlap bag.	Average 100-pound burlap bag.
	Per thousand.	*Per thousand.*	*Per thousand.*
1914	$89.92	$71.10	$75.95
1915	110.79	73.55	94.43
1916	133.10	99.35	110.16
1917	174.56	134.39	147.04
1918	328.87	256.38	273.97
1919	227.90	167.03	180.30
1920	224.78	157.63	169.40

CALIFORNIA CENTALS, 1915–1920.

California centals made to compete with bags imported from Calcutta showed about the same ratio of increase in price during the years 1915–1918 as other bags of domestic manufacture. According to the figures furnished by a domestic manufacturer, they increased in price from $56.25 per 1,000 bags on January 1, 1915, to $265 on July 1, 1918. Centals decreased to $130 on January 1 and July 1 of 1919. Unlike other bags of domestic manufacture, however,

the prices of centals did not show a further decline in 1920. As compared with an average price of $133.75 for 1919, the prices listed on the 1st of January and of July, 1920, averaged $172.50.

Commenting upon the prices of centals for 1920, the manufacturer furnishing such data writes:

* * * We might state on the 1st of June this year (1920) the price of grain bags was 23 cents, and on the 1st of August the bags could be purchased at 15 cents. Such a difference in the busy season is, of course, quite unusual, and this condition is brought about largely by speculation. The price of 23 cents on June 1 was too high and the price of 15 cents on August 1, 1920, was far below the cost of importation.

In terms of other domestic bags of the same capacity, and manufactured for about the same purpose, centals are ordinarily from 15 to 25 per cent lower in price.

SECONDHAND BURLAP BAGS, 1914–1919.

The prices of secondhand burlap bags increased steadily during the years 1915–1918 and then declined in 1919. The average price of 100-pound feed bags and of 100-pound granulated-sugar bags and of 140-pound flour export bags will serve as an example.

Prices of secondhand burlap bags, 1914–1919.

Year.	Average 100-pound feed bag.	Granulated-sugar bag.	Average 140-pound burlap bag.
	Per thousand.	*Per thousand.*	*Per thousand.*
1914	$56.00	$46.66	$74.00
1915	52.00	35.00	63.75
1916	66.11	41.50	92.50
1917	95.44	56.00	116.79
1918	166.89	109.00	231.25
1919	120.00	77.50	144.73

Secondhand burlap bags usually sell about 30 per cent less than new bags of the same type.

NEW COTTON BAGS, 1914–1920.

A survey of the selling prices of new cotton bags during the years 1914–1920 shows that the percentages of increase or decrease in the selling prices of different types of cotton bags were practically the same.

Prices of new cotton bags, 1914–1920.

Year.	Average one-fourth barrel.	Average one-half barrel.	Average 40 by 48 inches.
	Per thousand.	*Per thousand.*	*Per thousand.*
1914	$49.74	$75.95	$84.75
1915	42.19	63.34	64.40
1916	51.93	79.07	83.37
1917	91.46	142.50	111.26
1918	146.14	245.16	270.62
1919	133.84	199.26	234.32
1920	193.90	305.27	324.00

Secondhand bags of cotton, like secondhand bags of burlap, rise or fall in value with the price of the new bags.

COMPETITIVE CONDITIONS.

NEW BAGS.

Foreign bags imported for consumption are the same in construction and are used for the same purposes as those of domestic manufacture.

Our imports of new bags are limited to one type, the California or Pacific coast cental, which measures 22 by 36, weighs 12 ounces, and is used to sack 100 pounds of wheat. The use of these bags is confined to the Pacific coast. In reply to the commission's question, "Was foreign competition keen in 1914–1919 and did competition extend east of the Rocky Mountains?" the reply of bag manufacturers located east of the Rocky Mountains was invariably that they had not experienced foreign competition in new bags during these years. Likewise, manufacturers on the Pacific coast agree that foreign competition outside of the centals is negligible.

Foreign competition in this type is possible because the California cental is a standard bag, unprinted, and used in very large quantities. As India has practically no facilities for printing, her competition in this country is, of necessity, limited to a few types of bags. Likewise, as she must ship the bags a considerable distance and as her workmen are relatively unskilled, she did not find it profitable under the tariff rates of the act of 1913 to fill orders calling for small quantities, or for bags of special construction.

The extent to which American firms can participate in supplying the domestic demand for centals depends upon two factors: (1) The price of imported bags, and (2) whether it is possible to buy burlap for early shipment to compete with bags and burlap for later shipment.

There have been times when the imported bags could be landed in California at a lower price than that at which they could be manufactured locally. This has been due in part to the great fluctuations common in the jute trade, and in part to the fact that in their eagerness for the trade in centals Calcutta jute manufacturers often quote a price on bags, lower, notwithstanding the duty, than on the raw material, which is admitted free of duty. For instance, a Pacific coast manufacturer states that in August, 1920, it was not possible at that time to import cloth for manufacture into bags for use in the following season in competition with the price quoted by Calcutta firms on centals for delivery in 1921.

A larger part of such bags could be supplied by the local trade were it not for the fact that the price of burlap is generally higher in Calcutta during the last half of the year, which limits the amount of cloth brought forward during the last half of any year for the purpose of manufacturing for the coming harvest and for competing with foreign bags shipped during the first half of the year. Consequently, the percentage of grain bags manufactured by local dealers depends on their ability to secure burlap for shipment early enough to allow them time to manufacture it into bags.

Dependence upon India for the materials used in making jute bags not only serves as a handicap to manufacturers located on the Pacific coast, but makes it unprofitable for firms in the eastern part of the United States to engage in the manufacture of heavy twilled Cuban and Porto Rican sugar bags, of which about 70,000,000 pounds were

consumed yearly in Cuba during 1915–1918, and of which a large part is transshipped by way of the United States. The duty levied in the act of 1913 on the twilled material used in these bags and on bags made from this material was the same, 35 per cent, whereas in the case of the wheat bags used on the Pacific coast the cloth used was duty free and the bags made from the material were dutiable at 10 per cent. With a differential of 10 per cent the Pacific coast manufacturer could fill about one-third of the domestic requirements for centals, whereas with no differential on sugar bags, manufacturers on the eastern coast have not attempted to compete with the Calcutta jute mills in supplying the demand for Cuban and Porto Rican sugar bags.

Such bags may be made in this country and exported with the benefit of drawback. The president of a firm which makes a specialty of manufacturing 100-pound double sugar bags, and which ships heavy sugar bags to Cuba, does not think that this refund is a great enough inducement to engage in this trade. In this connection he says:

> We realize the fact that we would get a refund of 99 per cent duty for drawbacks on these bags, but the manufacturing cost would be very much more in this country than in Calcutta. It would also necessitate printing each bag with the word "drawback" on same, which would be an additional expense. Therefore, all these goods are generally bought by American manufacturing dealers from Calcutta houses, shipped in bond to either New York or New Orleans and sometimes to the Pacific coast and stored either in bonded warehouses in different places or shipped direct from the vessels arriving at the different ports to Cuba and Porto Rico.

The advantages which the Calcutta producer possesses enabling him to dominate in those markets which require large quantities of jute cloth and bags are:

1. A monopoly of the raw material, jute, and the consequent saving of freight charges.

2. An abundance of cheap docile labor whose wages are lower than those paid in this country, but whose efficiency is less. For instance, in June, 1918, the monthly wages of certain classes of Indian jute operatives were, on the basis of pre-war exchange rates, as follows: Carders, $2.91; rovers, $3.89; spinners, $4.78; winders, $5.84; weavers, $8.76.[5]

3. Longer working hours, both in the matter of hours worked per day by employees and the number of hours in which machinery is run. In 1913 a day's work in an Indian jute mill consisted of 13½ hours. Later this was changed to 11 hours. According to the latest available reports a change was made in 1916 from operating the mill 11 hours a day on a single shift to 13 hours per day on a three-shift system, each operative laboring 9 hours per day.

In the lack of skilled help, India is at a disadvantage. From the standpoint of productivity per employee, the output in India is much lower than in Dundee and in the United States. In Dundee, for instance, one operative can manage two looms, whereas in India the ratio is one operative per loom.

The most recent and most authoritative statement regarding the efficiency of the Indian jute operative is to be found in the report of the Indian Industrial Commission, 1916–1918, which was pub-

[5] Report of the Indian Industrial Commission, 1916–1918 (Cmd. 51), p. 15.

lished in the early part of 1919. After giving a statement of specimen wages paid to jute mill operatives, the report adds:

> Mill owners complain of the unwillingness of their laborers to respond to the stimulus of higher wages. The latter do not as a rule increase their output when engaged on piecework, but merely work fewer days in the week. The reasons for this were investigated in some detail by us. We have little doubt that the long hours passed in the uncongenial if not unhealthy surroundings of a factory from which the laborer returns at night to a dirty, crowded, and insanitary hovel, where his only relaxations are found in the liquor shop and the bazaar, are most unattractive to a man accustomed to rural life, and it is only the congestion existing in his native district and his desire to earn higher wages for a time that lead him to submit to such conditions. The mill workers of Bombay and Calcutta do not for the most part remain permanently at the mills, but return after a longer or shorter period to their native villages, though they eventually drift back in many cases to the mills. This practice affords a much needed change from the conditions under which the labor force lives and works, conditions which can never create a skilled and steady class of operatives. The laborers are, moreover, almost entirely uneducated * * *.[6]

As regards machinery, however, that used by the India jute mills is of the best. In making bags, only a minimum of machinery is required and of such simple types as are used the world over.

COMPARISON LANDED COSTS 1,000 CENTALS WITH COSTS OF MANUFACTURING THEM IN THIS COUNTRY.

The advantages of the Indian producer of centals can be best judged by comparing the landed cost per thousand grain bags with the cost of buying the cloth and making up the bags on the Pacific coast. Such data were supplied by the president of one of the largest concerns located west of the Rocky Mountains, who, in a letter dated December 15, 1920, furnishes the following information regarding purchases of wheat centals and cloth for their manufacture:

Wheat centals purchased in India, Dec. 9, 1920, for January–March shipment:		
Cost f. o. b., rupees 21⅜ per 1,000 bags		$53.44
Freight and insurance		6.30
Duty		5.35
Total landed cost per 1,000 bags		65.09
Cloth for wheat centals, purchased Dec. 8, 1920, for December shipment:		
Cost f. o. b., rupees 15⅛ per 1,000 yards		39.22
Freight and insurance		4.41
Cost per 1,000 yards		43.63
Cost of manufacturing centals on Pacific coast:		
1,300 yards required for 1,000 bags, at $43.63		56.71
Manufacturing cost—		
Twine	$2.32	
Labor	7.87	
Depreciation, maintenance and factory supplies	1.00	
		11.19
Total cost of manufacturing on Pacific coast, per 1,000 bags		67.90

Difference in favor of Indian manufacturer, $2.81 per thousand.

In estimating the above, the rupee is valued at 25 cents, which was its approximate value for the week previous to the forwarding of the above information.

India's advantages for manufacturing jute goods are so pronounced that two American concerns, which supply the greater

[6] Report of the Indian Industrial Commission, 1916–1918, p. 15.

part of the domestic requirements for cotton bagging, have built plants in Calcutta for the manufacture of such goods there, and still others are contemplating the erection of plants for making burlap and burlap bags for export to this country. Another cause that will tend to increase the competition is that a number of Calcutta houses have recently established branch offices on the Pacific coast.

COTTON BAGS.

The American manufacturer of cotton bags is free from competition in his home markets. This is likely to continue while the United States holds its present rank as a grower of cotton and as an exporter of cotton cloth.

SECONDHAND BAGS.

Imports from the United Kingdom during the 20 years 1900–1919 were in no year of sufficient volume to affect seriously the domestic market. Even if all of the bags exported from this source to the United States in the years 1900–1919 consisted of secondhand bags, and if none were designed for transshipment, the largest number for any one year in this period was in 1909, when the total was 6,243,612 bags; this is equal to about 2 per cent of the number of secondhand bags sold yearly in this country.

If Dundee bag producers possess any advantages over their American competitors, these advantages arise chiefly from the fact that the jute industry was started in Dundee and, consequently, the operatives have been longer experienced in this field.

The jute operatives are among the lowest paid of the textile workers in the United Kingdom. For the week ended February 21, 1920, from data submitted as to the wages of 10,737 mill employees working in Dundee and surrounding district, the average wages paid to a spinner were $7.78 and to a weaver $8.94 per week, which wages represent increases from 16.7 to 19.9 per cent over those prevailing during the previous year.[7]

The short working hours and the unemployment existing in the Scottish jute trade in the latter part of 1920, owing to the lack of coal and the depression of the trade as a whole, make the above data a more reliable index of the wages paid than that available for the last quarter of 1920.

TARIFF HISTORY.

BURLAP BAGS.

Jute products are mentioned for the first time in the act of 1846. Gunny bags were not specifically mentioned, however, until 1864. The act of 1883 distinguished three general classes of gunny bags: (1) Bagging for cotton or other manufactures, gunny bags, gunny cloth, valued at 7 cents or less per square yard, at 1½ cents per pound; valued at over 7 cents per square yard, 2 cents per pound; (2) bags and bagging and like manufactures not especially enumerated, except bagging for cotton gunny cloth, gunny bags, at 40 per centum ad valorem; and (3) gunny bags and gunny cloth, old refuse, fit only for remanufacture, free of duty.

[7] Labour Gazette, London, England, March, 1920.

As a part of the act of 1883 there was incorporated the provision relating to articles the growth, produce, and manufacture of the United States, which, when returned in the same condition as exported, were to be admitted free of duty. Bags were specifically referred to among "other vessels of American manufacture exported filled with American products, or exported empty and returned filled with American products."

In the act of 1890 the specific provisions relating to bags were: (1) Bags for grain made of burlap, at 2 cents per pound; (2) gunny bags and gunny cloths, old or refuse, fit only for remanufacture, free.

This arrangement was made the basis of the tariff legislation on bags passed in 1894, which combined "burlaps and bags for grain made of burlaps" into one paragraph of the free list, and continued in force the paragraph relating to bags fit only for remanufacture.
